1.HT

[Name]	Horizontal tab
[Format]	ASCII HT
	Hex 09
	Decimal 9
[Description]	Moves the print position to the next horizontal tab position.
[Notes]	◆ This command is ignored unless the next horizontal tab position has been set.
	◆ If the next horizontal tab position exceeds the printing area, the printer sets the printing position to [printing area width + 1].
	◆ Horizontal tab positions are set with ESC D .
	◆ If this command is received when the printing position is at [printing area width + 1], the printer executes print buffer-full printing of the current line and horizontal tab processing from the beginning of the next line.
[Reference]	ESC D

2.LF

[Name]	Print and line feed
[Format]	ASCII LF
	Hex 0A
	Decimal 10
[Description]	Prints the data in the print buffer and feeds one line, based on the current line spacing.

3.CR

[Name]	Print and carriage return
[Format]	ASCII CR
	Hex 0D
	Decimal 13
[Description]	This command will print the date of the buffer area, but not feedpaper.
[Notes]	<ul style="list-style-type: none">• This command line feed is ignored with a serial interface model.• Sets the print starting position to the beginning of the line.

[Notes]	<ul style="list-style-type: none">• When the status is transmitted, the printer only transmits one-byte but not affirm the condition of DSR signal.• This command is executed even when the printer is offline, the receive buffer is full, or there is an error status with a serial interface model.• With a parallel interface model, this command cannot be executed when the printer is busy. This command is executed even when the printer is offline or in error status, with a parallel interface model.• When Auto Status Back (ASB) is enabled using the GS a command, the status transmitted by the DLE EOT command and the ASB status must be differentiated.• If printer not select outside device command, ESC = select the command still effective.• The printer executes this command upon receiving it.• The status is transmitted whenever the data sequence

<10>H<04>H<n>

($1 \leq n \leq 4$) is received.

Example:

In **ESC m nL nH d1...dk**, $d1=<10>H$, $d2=<04>H$,
 $d3=<01>H$

- Do not use this command within another command that consists of 2 or more bytes.

Example:

If you attempt to transmit **ESC 3 n** to the printer, but DTR (DSR for the host computer) goes to MARK before n is transmitted and then **DLE EOT 3** interrupts before n is received, the code <10>H for **DLE EOT 3** is processed as the code for **ESC 3 <10>H**.

[Description] Transmits the status specified by n as follows:

n	Function
1, 49	Transmits paper sensor status
2, 50	Transmits drawer status

- [Notes]
- When using a serial interface
When DTR/DSR control is selected, the printer transmits only 1 byte after confirming the host is ready to receive data (DSR signal is SPACE). If the host computer is not ready to receive data (DSR signal is MARK), the printer waits until the host is ready.
When XON/XOFF control is selected, the printer transmits only 1 byte without confirming the condition of the DSR signal.
 - This command is executed when the data in the receive buffer is developed. Therefore, there may be a time lag between receiving this command and transmitting the status, depending on the receive buffer status.
 - When Auto Status Back (ASB) is enabled using **GS a**, the status transmitted by **GS r** and the ASB status must be differentiated using.
 - The status types to be transmitted are shown below:

Paper sensor status (n = 1, 49):

Bit	Off/On	Hex	Decimal	Status for ASB
0,1	-	-	-	Undefined.
2,3	Off	00	0	Paper roll end sensor: paper adequate.
