Part II

- None

- ▶ New: **2.1.9 Input** – str_input(), int_input, ip_input functions added
- ▶ Modified: **2.4.1** – definition of Subscript 7 [bit 7] in WedgeSetting array
- ▶ Modified: **2.14.5** – auto_flush() function added
- ▶ Modified: **2.14.6** – flush_DBF() function added
- ▶ Modified: **Appendix I** –

Symbology Parameter Table for CCD/Laser Reader:

ScannerDesTbl[]:

- *Byte 9 [bit 7~6] = '00' (default)
- *Byte 9 [bit 5~4] = '00' (default)
- *Byte 9 [bit 0] = '0' (default)

Symbology Parameter Table for 2D Reader:

- *Byte 5 [bit 5] = '1' (default)
- *Byte 5 [bit 0] = '1' (default)
- *Byte 6 [bit 4] = '1' (default)
- *Byte 9 [bit 7~6] = '00' (default)
- *Byte 10 [bit 1] = '0' (default)
- *Byte 11 [bit 7] = '0' (default)
- *Byte 25 [bit 6] = '1' (default)

- ▶ Modified: **Appendix I** –

Symbology Parameter Table for 2D Reader:

- *Byte 44 [bit 2] = '0' (default) appended
- *Byte 44 [bit 1] = '0' (default) appended

- ▶ Modified: **Appendix II** –

Scan Engine – CCD or Laser:

- *Byte 9 [bit 7~6] = '00' (default)
- *Byte 9 [bit 5~4] = '00' (default)
- *Byte 9 [bit 0] = '0' (default)

Scan Engine – 2D:

- *Byte 5 [bit 5] = '1' (default)
- *Byte 5 [bit 0] = '1' (default)
- *Byte 6 [bit 4] = '1' (default)
- *Byte 9 [bit 7~6] = '00' (default)
- *Byte 10 [bit 1] = '0' (default)
- *Byte 11 [bit 7] = '0' (default)
- *Byte 25 [bit 6] = '1' (default)

- ▶ Modified: **Appendix II** –

Scan Engine – 2D: (2D Symbologies):

- *Byte 44 [bit 2] = '0' (default) appended
- *Byte 44 [bit 1] = '0' (default) appended

Part II

- ▶ Modified: **Appendix III** –

Bluetooth Examples – Bluetooth HID:

definition of Subscript 7 [bit 7] in WedgeSetting array

USB Examples – USB HID:

definition of Subscript 7 [bit 7] in WedgeSetting array

1.07 No. 12, 2015 Part I

- ▶ Modified: **2.1.1** – return value '128' for CheckWakeUp added
- ▶ Modified: **2.1.1** – clear_bss() function added
- ▶ Modified: **Appendix I** – Byte 4, bit 3 added to ScannerDesTbl[]
- ▶ Modified: **Appendix I** – ScannerDesTbl2[] added
- ▶ Modified: **Appendix II – Scan Engine – CCD or Laser – UPC/EAN Families – UPC-E**: Byte4, bit 3 UPC/EAN security added
- ▶ Modified: **Appendix II – Scan Engine – CCD or Laser – UPC/EAN Families – EAN-13 Addon Mode, Addon Security for UPC/EAN** added

Part II

- ▶ Modified: **1.4.1** – 0x09 BT_ACL_36XX added in Setting for Bluetooth
- ▶ Modified: **4.1.3** – values of 802.11n added for NetStatus structure
- ▶ Modified: **4.1.4** – values revised for RadioStatus structure

1.06 May 07, 2015 Part I

- ▶ Modified: **2.4.1** – value of Subscript 0: Bit7-0 revised
Subscript 2: Bit 7 added
- ▶ Modified: **2.4.1** – 1st ELEMENT: KBD/Terminal Type (Terminal Type revised for value 11 ~ 15)
- ▶ Modified: **2.4.1** – 3rd ELEMENT: INTER-CHARACTER DELAY (time range & example revised)
- ▶ Modified: **2.10.1** – ConfigureTriggerKey function added
- ▶ Modified: **2.12.4** – FONT_SYS_08X16, FONT_SYS_14X28 added for CheckFont, GetFont, and SetFont functions
- ▶ Modified: **2.12.4** – 0x100 UTF-8 added for SetLanguage function

Part II

- ▶ Modified: **1.4.1** – settings for USB Mass Storage Device added
- ▶ Modified: **5.1** – CipherLab ACL Packet Data added
- ▶ Modified: **5.2.1** – ACL36xx[16], ReservedByte[204]
- ▶ New: **5.3.5 ACL Functions**
- ▶ Modified: **Appendix III** – Wedge Emulator section removed
- ▶ Modified: **Appendix III** – ACL added in Bluetooth Examples section
- ▶ Modified: **Appendix III** – USB Mass Storage Device: description for open_com revised

- 1.05 Jan. 07, 2015 Part I
- ▶ Modified: **2.1.3** – comment added for AUTO_OFF
 - ▶ Modified: **2.3.2** – scanMode, scanTimeout added for RFID parameter structure
 - ▶ Modified: **2.4.1** – Subscript 2, Bit 6-1 & 0 added
 - ▶ Modified: **2.11.7** – statement for JPEG library added
 - ▶ Modified: **2.12.2** – table of Display Capability updated
 - ▶ Modified: **2.14.6 DBF Files and IDX Files** –
lseek_DBF/member_in_DBF/tell_DBF: on error, it returns -1
rebuild_index: returns 1 for success; returns 0 for failure

Part II

- ▶ New: **3.4 WISPr Library**
- ▶ Modified: **5.3.3** – parameter BTOBEXFTEServer removed from BTPairingTest
- ▶ Modified: **Appendix III** – Bluetooth HID & USB HID: Subscript 2, Bit 6-1 (Inter-character delay) added

- 1.04 Sep. 03, 2014 Part I
- ▶ Modified: **2.11.6 Graphics** – SHAPE_FILL of circle/rectangle corrected
 - ▶ Modified: **2.12.1 Font Size** – new font files added
 - ▶ Modified: **2.12.4 Special Fonts** – CheckFont, GetFont, SetFont updated
 - ▶ Modified: **2.12.5 Font Files** – new font files added
 - ▶ Modified: **Appendix I (SYMBOLGY PARAMETER TABLE II)** – Byte 26/Bit 6 changed to 'Reserved' (ISBT 128 not supported)
 - ▶ Modified: **Appendix II (Scan Engine, 2D)** – Code 128: ISBT-128 removed

Part II

- None

1.03 Aug. 05, 2014 Part I

- ▶ Modified: **2.2** – ConfigureReaderRAM function added
- ▶ Modified: **2.11.1** – BacklitOn function added
- ▶ Modified: **2.11.7** – ShowJPG, ShowJPGBz functions added
- ▶ Modified: **2.13.3** – fsize, ffreebyte functions revised
- ▶ Modified: **2.14.5** – fformat function revised
- ▶ Modified: **Appendix I (SYMBOLGY PARAMETER TABLE I)** – Byte 11/Bit 5 (GTIN -> GTIN-14)
- ▶ Modified: **Appendix I (SYMBOLGY PARAMETER TABLE II)** – Byte 2/Bit 5 (0: Disable MSI set to default), Byte43/Bit 4-1 (illumination level) added
- ▶ Modified: **Appendix II (Scan Engine, CCD or Laser)** – Byte 11/Bit 5 (GTIN -> GTIN-14)
- ▶ Modified: **Appendix III (User Preference)** – Byte 43/Bit 4-1 (illumination level) added

Part II

- None

1.02 Jun. 17, 2014 Part I

- ▶ Modified: **2.12.1** – the Kr font file removed
- ▶ Modified: **2.12.4** – return value concerning KR removed (CheckFont, Get Font, SetFont)
- ▶ Modified: **2.12.5** – Font8600-KR20.shx, Font8600-KR24.shx removed

Part II

- None

1.01	May 13, 2014	<p>Part I</p> <ul style="list-style-type: none"> ▶ Modified: 1.1.1 – descriptions updated ▶ Modified: 2.2.1 – global array FsEAN128[2], AlMark[2] added ▶ Modified: 2.10.1 – SetTrig2Key added ▶ New: 2.11.7 Color Display – SetColor, GetColor, ShowPic, GetPic functions added ▶ Modified: Appendix I (SYMBOLGY PARAMETER TABLE I) – [Byte 11/Bit 6], [Byte 7/Bit 2,1] added ▶ Modified: Appendix I (SYMBOLGY PARAMETER TABLE II) – [Byte 44/Bit 7,6,5,4,3] , [Byte 43/Bit 7,6,5] , [Byte 7/Bit 2] added ▶ Modified: Appendix II (Scan Engine, CCD or Laser) – [Byte 11/Bit 6], [Byte 7/Bit 2,1] added ▶ Modified: Appendix II (Scan Engine, 2D) – [Byte 7/Bit 2,1], [Byte 44/Bit 7,6,5,4,3] added ▶ Modified: Appendix III – Byte 43/Bit 7 added (User Preferences), Byte 43/Bit 6,5 added (Reader Redundancy) <p>Part II</p> <ul style="list-style-type: none"> ▶ Modified: 4.1.1 NETCONFIG Structure – RssiThreshold, Rssidelta, RoamingPeriod added ▶ Modified: Appendix I – index 91, 92, 93 added for GetNetParameter/SetNetParameter

INTRODUCTION

This C Programming Guide describes the application development process with the “C” Compiler in details. It starts with the general information about the features and usages of the development tools, the definition of the functions/statements, as well as some sample programs.

This programming guide is meant for users to write application programs for CipherLab 8600 Series Mobile Computers by using the “C” Compiler. It is organized in chapters giving outlines as follows:

Part I: Basics and Hardware Control

- Chapter 1 “Development Environment” – gives a concise introduction about the “C” Compiler and the development flow for applications, which provides step-by-step description in developing application programs for the mobile computers with the “C” Compiler.
- Chapter 2 “Mobile-specific Function Library” – presents callable routines that are specific to the features of the mobile computers. For data communications, refer to Part II.
- Chapter 3 “Standard Library Routines” – briefly describes the standard ANSI library routines for in many ANSI related literatures there can be found more detailed information.
- Chapter 4 “Real Time Kernel” – discusses the concepts of the real time kernel, μ C/OS. Users can generate a real time multi-tasking system by using the μ C/OS functions.

Part II: Data Communications

- Chapter 1 “Communication Ports”
- Chapter 2 “TCP/IP Communications”
- Chapter 3 “Wireless Networking”
- Chapter 4 “IEEE 802.11b/g/n”
- Chapter 5 “Bluetooth”
- Chapter 6 “USB Connection”
- Chapter 7 “GPS Functionality”
- Chapter 8 “FTP Functionality”

COMMUNICATION PORTS

There are at least two communication (COM) ports on each mobile computer, namely *COM1* and *COM2*. The user has to call **SetCommType()** to set up the communication type for the COM ports before using them.

The table below shows the mapping of the communication (COM) ports. With the type of interface specified, the user can use the same routines to open, close, read, and write data.

COM1	COM2	COM4	COM5	COM6
RS-232	Bluetooth	RFID	USB	Fast VPort

Note: The Bluetooth profiles supported include SPP, DUN, and HID.

IN THIS CHAPTER

1.1 Basics.....	4
1.2 Flow Control	5
1.3 Configure Settings	8
1.4 Open and Close COM	9
1.5 Read and Write Data	11

1.1 BASICS

1.1.1 COMMUNICATION PARAMETERS

RS-232 Parameters	
Baud Rate:	115200, 57600, 38400, 19200, 9600, 4800
Data Bits:	7 or 8
Parity:	Even, Odd, or None
Stop Bit:	1
Flow Control:	RTS/CTS, XON/XOFF, or None
USB/Fast VPort Parameters	
Baud Rate:	Ignored, included only for compatibility in coding.
Data Bits:	Ignored, included only for compatibility in coding.
Parity:	Ignored, included only for compatibility in coding.
Stop Bit:	Ignored, included only for compatibility in coding.
Flow Control:	Ignored, included only for compatibility in coding.

1.1.2 RECEIVE & TRANSMIT BUFFERS

Receive Buffer

A 256-byte FIFO buffer is allocated for each port. The data successfully received is stored in this buffer sequentially (if any error occurs, e. g. framing, parity error, etc., the data is simply discarded). However, if the buffer is already full, the incoming data will be discarded and an overrun flag is set to indicate this error.

Transmit Buffer

The system does not allocate any transmit buffer. It simply records the pointer of the string to be sent. The transmission stops when a null character (0x00) is encountered. The application program must allocate its own transmit buffer that should not be modified during transmission.

1.2 FLOW CONTROL

To avoid data loss, three options of flow control are supported and done by background routines.

- 1) None (= Flow control is disabled.)
- 2) RTS/CTS
- 3) XON/XOFF

Note: Flow control is only applicable to the direct RS-232 COM port, which is usually assigned as COM1.

1.2.1 RTS/CTS

RTS now stands for *Ready for Receiving* instead of *Request To Send*, while CTS for *Clear To Send*. The two signals are used for hardware flow control.

Receive

The RTS signal is used to indicate whether the storage of receive buffer is free or not. If the receive buffer cannot take more than 5 characters, the RTS signal is de-asserted, and it instructs the sending device to halt the transmission. When its receive buffer becomes enough for more than 15 characters, the RTS signal becomes asserted again, and it instructs the sending device to resume transmission. As long as the buffer is sufficient (may be between 5 to 15 characters), the received data can be stored even though the RTS signal has just been negated.

Transmit

Transmission is allowed only when the CTS signal is asserted. If the CTS signal is negated (= de-asserted) and later becomes asserted again, the transmission is automatically resumed by background routines. However, due to the UART design (on-chip temporary transmission buffer), up to five characters might be sent after the CTS signal is de-asserted.

1.2.2 XON/XOFF

Instead of using RTS/CTS signals, two special characters are used for software flow control — XON (hex 11) and XOFF (hex 13). XON is used to enable transmission while XOFF to disable transmission.

Receive

The received characters are examined to see if it is normal data (which will be stored to the receive buffer) or a flow control code (set/reset transmission flag but not stored). If the receive buffer cannot take more than 5 characters, an XOFF control code is sent. When the receive buffer becomes enough for more than 15 characters, an XON control code will be sent so that the transmission will be resumed. As long as the buffer is sufficient (may be between 5 to 15 characters), the received data can be stored even when in XOFF state.

Transmit

When the port is opened, the transmission is enabled. Then every character received is examined to see if it is normal data or flow control codes. If an XOFF is received, transmission is halted. It is resumed later when XON is received. Just like the RTS/CTS control, up to two characters might be sent after an XOFF is received.

Note: If receiving and transmitting are concurrently in operation, the XON/XOFF control codes might be inserted into normal transmit data string. When using this method, make sure that both sides feature the same control methodology; otherwise, dead lock might happen.

1.2.3 FUNCTIONS

com_cts

Purpose To check the current CTS state on the direct RS-232 port.

Syntax **U32 com_cts (U32 port);**

Parameters

U32 port

1	COM1 for RS-232 port
----------	----------------------

Example

```
if (com_cts(1) == 0) printf("COM 1 CTS is negated");
    else printf("COM 1 CTS is asserted");
```

Return Value If asserted, it returns 1. (= Mark)
Otherwise, it returns 0. (= Space)

com_rts

Purpose To set the RTS signal on the direct RS-232 port.

Syntax **void com_rts (U32 port, U32 val);**

Parameters

U32 port

1	COM1 for RS-232 port
----------	----------------------

int val

0	RTS signal is negated.
----------	------------------------

1	RTS signal is asserted.
----------	-------------------------

Example `com_rts(1, 1);` // COM1 is set as RTS asserted

Return Value None

Remarks This routine controls the RTS signal. However, RTS might be changed by the background routine according to the status of the receive buffer.

1.3 CONFIGURE SETTINGS

1.3.1 FUNCTIONS

SetCommType

Purpose To set the communication type of a specific COM port.

Syntax **U32 SetCommType (U32 port, U32 type);**

Parameters

U32 port		
COM port to be used. Refer to the COM Port Mapping table.		
U32 type		
0	COMM_DIRECT	Direct RS-232
4	COMM_RF	RF, Bluetooth SPP/DUN/HID
7	COMM_USBHID	USB HID
8	COMM_USBVCOM	USB Virtual COM
9	COMM_USBDISK	USB Mass Storage
10	COMM_USBVCOM_CDC	USB Virtual COM_CDC

Example `SetCommType(1, 0);` // set COM1 to Direct RS-232

Return Value If successful, it returns 1.

On error, it returns 0 to indicate the port number or type is invalid.

Remarks This routine needs to be called BEFORE opening a COM port. The argument passed to the 2nd parameter depends on the actual interface in use:

- (a) Pass COMM_DIRECT when it requires establishing an RS-232 connection, via cable or any kind of cradle.
- (b) Pass COMM_USBVCOM_CDC or COMM_USBVCOM when it requires establishing a USB virtual COM connection, via cable or any kind of cradle.
- (c) Pass COMM_USBVCOM_CDC or COMM_USBVCOM when it requires establishing a Fast VPort connection.

See Also GetIOPinStatus, open_com, SetACTone

1.4 OPEN AND CLOSE COM

1.4.1 FUNCTIONS

open_com

Purpose To enable a specific COM port and initialize communications.

Syntax **U32 open_com (U32 com_port, U32 setting);**

Parameters

U32 com_port		
COM port to be used. Refer to the COM Port Mapping table.		
U32 setting		
<i>Setting for RS-232</i>		
0x00	BAUD_115200	Baud rate (bps)
0x01	BAUD_57600	
0x02	BAUD_38400	
0x03	BAUD_19200	
0x04	BAUD_9600	
0x05	BAUD_4800 ^{Note}	
0x00	DATA_BIT7	Data bits
0x08	DATA_BIT8	
0x00	PARITY_NONE	Parity
0x10	PARITY_ODD	
0x30	PARITY_EVEN	
0x00	HANDSHAKE_NONE	Flow control method
0x40	HANDSHAKE_CTS	
0xc0	HANDSHAKE_XON	
<i>Setting for Bluetooth</i>		
0x00	BT_SERIALPORT_SLAVE	Bluetooth SPP Slave
0x03	BT_SERIALPORT_MASTER	Bluetooth SPP Master
0x04	BT_DIALUP_NETWORKING	Bluetooth DUN
0x05	BT_HID_DEVICE	Bluetooth HID
0x09	BT_ACL_36XX	Bluetooth ACL
<i>Setting for USB Mass Storage Device</i>		
0x00	SD_CARD & RAM_DISK	SD card & RAM disk
0x01	SD_CARD	SD card
0x02	RAM_DISK	RAM disk
0x03	SD_CARD & RAM_DISK	SD card & RAM disk

Example	<pre>open_com(1, 0x0b); // open COM 1 to 19200,8 data bits, no parity and no handshake open_com(4); // open COM4 for RFID virtual COM</pre>
Return Value	If successful, it returns 1. Otherwise, it returns 0 to indicate the port number is invalid.
Remarks	This routine initializes the specific COM port, clears its receive buffer, stops any ongoing data transmission, resets COM port status, and configures the COM port according to the settings. Note that the direct RS-232 port is usually COM1, and the virtual COM port assigned for Bluetooth serial port profile is COM2. However, only direct RS-232 allows for flow control options.
See Also	close_com, SetACTone, SetCommType

close_com

Purpose	To terminate communications and disable a specified COM port.
Syntax	U32 close_com (U32 port);
Parameters	Refer to the COM Port Mapping table.
Example	<pre>close_com(4); // close COM 4</pre>
Return Value	It always returns 1.
See Also	open_com

1.5 READ AND WRITE DATA

1.5.1 FUNCTIONS

clear_com

Purpose	To clear the receive buffer of a specific COM port.
Syntax	void clear_com (U32 port);
Parameters	Refer to the COM Port Mapping table.
Example	<code>clear_com(1);</code> <code>// clear the receive buffer of COM 1</code>
Return Value	None
Remarks	This routine clears all the data stored in the receive buffer. It can be used to avoid mis-interpretation when overrun or other error occurs.
See Also	com_overrun

com_eot

Purpose	To check whether there is any transmission in progress on COM1. (eot = End Of Transmission)
Syntax	U32 com_eot (U32 port);
Parameters	Refer to the COM Port Mapping table.
Example	<code>while (!com_eot(1));</code> <code>// wait till prior transmission completed</code> <code>write_com(1, "NEXT STRING");</code>
Return Value	If transmission is completed, it returns 1. Otherwise, it returns 0.

com_overrun

Purpose	To check whether overrun error occurs or not.
Syntax	U32 com_overrun (U32 port);
Parameters	Refer to the COM Port Mapping table.
Example	<code>if (com_overrun(1) > 0) clear_com(1);</code> <code>// if overrun, data stored in the buffer is not complete, clear them all</code>
Return Value	If overrun occurs, it returns 1. Otherwise, it returns 0.
See Also	clear_com

read_com	
Purpose	To read one character from the receive buffer of a specific COM port.
Syntax	U32 read_com (U32 <i>port</i>, U8 <i>*c</i>);
Parameters	U32 <i>port</i>
	COM port to be used. Refer to the COM Port Mapping table.
	U8 <i>*c</i>
	Pointer to the character returned.
Example	<pre>char c; if (read_com(1, c)) printf("char %c received from COM 1", *c);</pre>
Return Value	If successful, it returns 1.
	Otherwise, it returns 0 to indicate the buffer is empty.
Remarks	This routine reads one byte from the receive buffer and then removes it from the buffer. However, if the buffer is empty, it will return 0 for no action is taken.
See Also	nwrite_com, write_com

nwrite_com

Purpose	To send a number of characters through a specific COM port.
Syntax	U32 nwrite_com (U32 <i>port</i>, U8 *<i>s</i>, U32 <i>count</i>);
Parameters	U32 <i>port</i>
	COM port to be used. Refer to the COM Port Mapping table.
	U8 *<i>s</i>
	Pointer to the string being sent out.
	U32 <i>count</i>
	The number of characters to be sent.
Example	<pre>char s[]={"Hello\n"}; nwrite_com(1, s, 2); // send the characters "He" through COM1</pre>
Return Value	If successful, it returns the character count. (For Bluetooth SPP, it returns 1.) Otherwise, it returns 0.
Remarks	This routine sends the characters of a string one by one until the specified number of characters are sent out.

write_com	
Purpose	To send a null-terminated string through a specific COM port.
Syntax	U32 write_com (U32 port, U8 *s);
Parameters	int port
	COM port to be used. Refer to the COM Port Mapping table.
	U8 *s
	Pointer to the string being sent out.
Example	<pre>char s[]={"Hello\n"}; write_com(1, s); // send the string "Hello\n" through COM1</pre>
Return Value	<p>If successful, it returns the character count.</p> <p>Otherwise, it returns 0.</p>
Remarks	This routine sends a string through a specific COM port. If any prior transmission is still in progress, it will be terminated and then the current transmission resumes. The characters of a string will be transmitted one by one until a NULL character is met. Note that a null string can be used to terminate the prior transmission.

TCP/IP COMMUNICATIONS

All TCP/IP stack routines called by programs are detailed as follows in this chapter.

IN THIS CHAPTER

2.1 Native Programming Interface	16
2.2 Socket Programming Interface	20
2.3 Byte Swapping	44
2.4 Supplemental Functions	46

2.1 NATIVE PROGRAMMING INTERFACE

2.1.1 BASICS

- ▶ **Nopen()** is used to establish connections. After the connection is successfully established, **Nopen()** will return a connection number, which is used to identify this particular connection in subsequent calls to other TCP/IP stack routines.
- ▶ **Nclose()** is used to close a specific connection.
- ▶ **Nread()** and **Nwrite()** are used to send and receive data on the network.

Note: Before reading and writing to the remote host, a connection must be established or opened.

2.1.2 FUNCTIONS

Nclose			
Purpose	To close a connection.		
Syntax	S16 Nclose (S16 conno);		
Parameters	<table border="1"><tr><td>S16 conno</td></tr><tr><td>The connection to be closed. This connection number is a return value of Nopen().</td></tr></table>	S16 conno	The connection to be closed. This connection number is a return value of Nopen().
S16 conno			
The connection to be closed. This connection number is a return value of Nopen().			
Example	Nclose(conno);		
Return Value	If successful, it returns 0. On error, it returns a negative value to indicate a specific error condition.		
See Also	Nopen, socket_fin		

Nopen

Purpose To open a connection.

Syntax **S16 Nopen (const S8 *remote_ip, const S8 *proto, S16 lp, S16 rp, S16 flags);**

Parameters

const S8 *remote_ip

It can be one of these two forms:

- ▶ "n1.n2.n3.n4" for remote host IP;
- ▶ "*" for any host, passive open.

const S8 *proto

Protocol stack to be used, "TCP/IP" or "UDP/IP".

S16 lp

Local port number.

- ▶ If this is an active open (client), the local port is often an ephemeral port, and a suitable random value can be obtained using Nportno() or set lp to 0.

S16 rp

Remote port number.

- ▶ For a passive open (server), this value should be specified as 0, and any remote port will be accepted for the connection.

S16 flags

0	Normally, its value is set to 0.
S_NOCON	No connection for UDP.
S_NOWA	Non-blocking open
IPADDR	Remote_ip is binary (4 bytes)

Example

```
/* Passive Open (Server) */
conno = Nopen("","TCP/IP", 2000, 0, 0);
/* Active Open (Client) */
char remote_ip[] = "230.145.22.4";
if ((conno = Nopen(remote_ip, "TCP/IP", Nportno(), 2000, 0)) < 0)
printf("Fail to connect to Host: %s\r\n", remote_ip);
```

Return Value If successful, it returns the connection number. This is the handle for further communication on the connection.

On error, it returns a negative value to indicate a specific error condition.

Remarks This routine is used for both active and passive opens. The behavior is determined by the parameters supplied to the function.

- ▶ A passive open will wait indefinitely.
- ▶ An active open for TCP will return when the connection has been made, but it times out in a couple of minutes if there is no answer.
- ▶ To check whether or not the connection has established, use socket_isopen().

See Also Nclose, Nportno, socket_ipaddr, socket_isopen

Nread	
Purpose	To read a message from a connection.
Syntax	S16 Nread (S16 conno, S8 *buff, S16 len);
Parameters	S16 conno
	The connection to be accessed. This connection number is a return value of Nopen().
	S8 *buff
	Pointer to a receive buffer.
	S16 len
	Maximum number of bytes to read; normally equals to the size of the buffer.
Example	<pre>if (socket_hasdata(conno) > 0) Nread(conno, buf, sizeof(buf));</pre>
Return Value	If successful, it returns the number of bytes read. Otherwise, it returns 0 to indicate the connection is closed by the remote end. On error, it returns a negative value to indicate a specific error condition.
Remarks	This routine reads a number of bytes (<i>len</i>) from a connection (<i>conno</i>) into a specified buffer (<i>buff</i>). <ul style="list-style-type: none">▶ In blocking mode, this function will block until information is available to be read, or until a timeout occurs. The timeout can be adjusted using socket_rxtout().▶ The application can avoid this blocking behavior by using socket_hasdata to make sure there is data available before calling Nread().▶ The protocol stack will try to compact all of the data receiving from the remote side. This means the data obtained from Nread() maybe comes from different packets.
See Also	Nwrite, socket_hasdata, socket_rxtout

Nwrite

Purpose To write a message to a connection.

Syntax **S16 Nwrite (S16 conno, S8 *buff, S16 len);**

Parameters

S16 conno

The connection to be accessed. This connection number is a return value of Nopen().

S8 *buff

Pointer to a send buffer.

S16 len

Maximum number of bytes to write.

Example

```
if (socket_cansend(conno, strlen(buf)))
    Nwrite(conno, buf, strlen(buf));
```

Return Value If successful, it returns the number of bytes written.

On error, it returns a negative value to indicate a specific error condition.

Remarks

This routine writes a number of bytes (*len*) from a specified buffer (*buff*) to a connection (*conno*).

- ▶ The protocol stack will keep the data and send them in background. Normally, this routine will return immediately. However, it will take 1 to 8 seconds to send the data in the following cases:

Case 1 – In TCP, four packets have been sent, but never get any ACK.

The protocol stack will try to resend the packets until it times out (after 8 seconds). The application can avoid this situation by using socket_cansend to make sure the transmission is available before calling Nwrite().

Case 2 - In UDP, the protocol stack does not get MAC ID of the remote side. It will take 1 second to ask the remote side for MAC ID by ARP.

See Also Nread, socket_cansend

2.2 SOCKET PROGRAMMING INTERFACE

2.2.1 BASICS

Include File

```
#include <errno.h>
```

This header file, "*errno.h*", contains the error code definitions. This file should normally be placed under the "include" directory of the C compiler - C:\C_Compiler\INCLUDE\

Note: For relevant structures, please refer to the header file for mobile-specific library.

Connection-oriented Protocol (TCP)

For a connection-oriented socket, such as SOCK_STREAM, it provides full-duplex connection and must be in a connected state before any data can be sent or received on it. A connection to another socket is created with **connect()**. Once connected, data can be transferred using **send()** and **recv()**. When a session has been completed, **closesocket()** must be performed.

Connectionless Protocol (UDP)

For a connectionless, message-oriented socket, datagrams can be sent to and received from a specific connected peer using **sendto()** and **recvfrom()** respectively.

2.2.2 FUNCTIONS

accept

Purpose To accept a connection on a socket.

Syntax **S16 accept (SOCKET s, struct sockaddr *name, S16 *namelen);**

Parameters

SOCKET s
Descriptor identifying a socket in a listening state.
struct sockaddr *name
Pointer to a <i>sockaddr</i> structure, receiving the remote IP address and port number.
S16 *namelen
Pointer to an integer containing the length of name.

Example

```
SOCKET listen_socket, remote_socket;
struct sockaddr_in local_name, remote_name;
int size_of_name;
listen_socket = socket(PF_INET, SOCK_STREAM, TCP);
if (listen_socket < 0) {
    printf("SOCKET allocation failed");
    .....
}
memset(&local_name, 0, sizeof(local_name));
local_name.sin_family = AF_INET;
local_name.sin_port = htons(3000);
if (bind(listen_socket, (struct sockaddr*)&local_name,
sizeof(local_name)) < 0) {
    printf("Error in Binding on socket: %d", listen_socket);
    .....
}
if (listen(listen_socket, 1)) {
    printf("Error in Listening on socket: %d", listen_socket);
    .....
}
size_of_name = sizeof(remote_name);
remote_socket =
accept(listen_socket, (struct sockaddr*)&remote_name, &size_of_name);
if (remote_socket < 0) {
    printf("Error in accept on socket: %d", listen_socket);
    .....
}
```

	<pre>send(remote_socket, "Hello", strlen("Hello"), 0);</pre>
Return Value	<p>If successful, it returns a non-negative integer (≥ 0) as a descriptor for the accepted socket.</p> <p>On error, it returns -1. The global variable <i>errno</i> is set to indicate the error condition encountered.</p>
Remarks	<p>This routine is used by a server application to perform a passive open, permitting a connection request from client.</p> <ul style="list-style-type: none">▶ <i>name</i> is a result parameter that is filled in with the address of the connecting entity, as known to the communications layer. The exact format of the parameter is determined by the address family in which the communication is occurring.▶ <i>namelen</i> is a value-result parameter; it initially contains the amount of space pointed to by <i>name</i>; on return, it will contain the actual length, in bytes, of the address returned. <i>Name</i> is truncated if the buffer provided is too small. <p>The socket will remain in the listening state until a client establishes a connection with the port offered by the server.</p> <ul style="list-style-type: none">▶ The connection is actually made with the socket that is returned by this routine. <p>The original socket remains in the listening state, and can be used in a subsequent call to this routine to provide additional connections.</p> <p>Note that this is a blocking function. This routine will not return unless there is error or a new connection is established. If normal program flow is mandatory for the application or the application is going to accept multiple connection requests. This routine must be called in a separate task.</p>
See Also	connect, listen, select

bind

Purpose To bind a name to a newly created socket.

Syntax **S16 bind (SOCKET *s*, struct sockaddr **name*, S16 *namelen*);**

Parameters

SOCKET <i>s</i>
Descriptor identifying an unbound socket.
struct sockaddr *<i>name</i>
Pointer to a <i>sockaddr</i> structure containing the local IP address and listening port to be bounded.
S16 <i>namelen</i>
Length of name.

Example

```
SOCKET s;
struct sockaddr_in name;

s = socket(PF_INET, SOCK_STREAM, TCP);
if (s < 0) {
    printf("SOCKET allocation failed");
    .....
}

memset(&name, 0, sizeof(name));
name.sin_family = AF_INET;
name.sin_port = htons(3000);
if (bind(s, (struct sockaddr*)&name, sizeof(name)) < 0) {
    printf("Error in Binding on socket: %d", s);
    .....
}
```

Return Value

If successful, it returns 0.

On error, it returns -1. The global variable *errno* is set to indicate the error condition encountered.

Remarks

This routine binds the local IP address and listening port number information to the socket specified.

- ▶ For connection-oriented sockets (passive open), this routine must be called before calling `listen()` and `accept()`.
- ▶ The socket specified must be a valid descriptor returned from a previous call to the `socket()` routine.
- ▶ The local IP address specified can be left out as 0. The application can use `getsockname()` to learn the address and port that has been assigned to it.
- ▶ If it is other than 0, this routine will verify this information against the actual local IP address of the local device.

See Also

`connect`, `getsockname`, `listen`, `socket`

closesocket

Purpose To close a socket and release the connection block.

Syntax **S16 closesocket (SOCKET s);**

Parameters **SOCKET s**

Descriptor identifying a socket.

Example

```
SOCKET s;  
.....  
if (closesocket(s) < 0) {  
    printf("closesocket fails on socket: %d", s);  
    .....  
}
```

Return Value If successful, it returns 0.

On error, it returns -1. The global variable *errno* is set to indicate the error condition encountered.

See Also shutdown, socket

connect

Purpose To initiate a connection on a socket.

Syntax **S16 connect (SOCKET s, struct sockaddr *name, S16 namelen);**

Parameters	SOCKET s
	Descriptor identifying a socket.
	struct sockaddr *name
	Pointer to a <i>sockaddr</i> structure containing the remote IP address and port number.
	S16 namelen
	Length of name.

Example

```

SOCKET s;
struct sockaddr_in name;
struct hostent *phostent;
s = socket(PF_INET, SOCK_STREAM, TCP);
if (s < 0) {
    printf("SOCKET allocation failed");
    .....
}
memset(&name, 0, &sizeof(name));
name.sin_family = AF_INET;
name.sin_port = htons(3000);
phostent = gethostbyname("server1.cipherlab.com.tw");
if (!phostent) {
    printf("Can not get IP from DNS server");
    .....
}
memcpy(&name.sin_addr, phostent->h_addr_list[0], 4);
if (connect(s, (struct sockaddr*)&name, sizeof(name)) < 0) {
    printf("Error in Establishing connection");
    .....
}

```

Return Value If successful, it returns 0.

On error, it returns -1. The global variable *errno* is set to indicate the error condition encountered.

Remarks This routine establishes a connection to a specified socket. It performs an active open (client mode), allowing a client application to establish a connection with a remote server. When it completes successfully, the socket is ready to send/rcv data.

See Also accept, getpeername, getsockname, listen, select, socket

fcntlsocket

Purpose To provide file control over descriptors.

Syntax **S16 fcntlsocket (S16 *fildes*, S16 *cmd*, S16 *arg*);**

Parameters

S16 <i>fildes</i>	
Descriptor to be operated on by <i>cmd</i> as described below.	
S16 <i>cmd</i>	
O_NDELAY	Non-blocking
FNDELAY O_NDELAY	Synonym
F_GETFL	Get descriptor status flags. (<i>arg</i> is ignored)
F_SETFL	Set descriptor status flags to <i>arg</i> .
int <i>arg</i>	
Depending on the value of <i>cmd</i> , it can take an additional third argument <i>arg</i> .	

Example (. . .)

Return Value If successful, it returns a non-negative value depending on *cmd*.
On error, it returns -1. The global variable *errno* is set to indicate the error condition encountered.

gethostbyname	
Purpose	To get the IP address of the specified host from DNS server.
Syntax	struct hostent *gethostbyname (const S8 *hnp);
Parameters	<div> <div>const S8 *hnp</div> <div>Pointer to a buffer containing a null-terminated hostname.</div> </div>
Example	<pre> SOCKET s; struct sockaddr_in name; struct hostent *phostent; s = socket(PF_INET, SOCK_STREAM, TCP); if (s < 0) { printf("SOCKET allocation failed"); } memset(&name, 0, sizeof(name)); name.sin_family = AF_INET; name.sin_port = htons(3000); phostent = gethostbyname("server1.cipherlab.com.tw"); if (!phostent) { printf("Can not get IP from DNS server"); } memcpy(&name.sin_addr, phostent->h_addr_list[0], 4); if (connect(s, (struct sockaddr*)&name, sizeof(name)) < 0) { printf("Error in Establishing connection"); } </pre>
Return Value	<p>If successful, it returns a pointer.</p> <p>On error, it returns a NULL pointer.</p>
Remarks	<p>This routine searches for information by the given hostname specified by the character-string parameter <i>hnp</i>.</p> <p>It then returns a pointer to a struct <i>hostent</i> structure describing an internet host referenced by name.</p> <p>► The IP address of DNS server can be automatically retrieved from DHCP server, if <i>DhcpEnable</i> is set.</p>
See Also	DNS_resolver

getpeername

Purpose To get name of a connected peer.

Syntax **S16 getpeername (SOCKET *s*, struct sockaddr **name*, S16 **namelen*);**

Parameters

SOCKET <i>s</i>
Descriptor identifying a socket.
struct sockaddr *<i>name</i>
Pointer to a <i>sockaddr</i> structure receiving the remote IP address and port number.
S16 *<i>namelen</i>
Pointer to an integer containing the length of name.

Example

```
SOCKET s;
struct sockaddr_in remote_name;
int size_of_name;
.....
size_of_name = sizeof(remote_name);
if (getpeername(s, (struct sockaddr*)&remote_name, &size_of_name) < 0)
{
    printf("Can not get remote name info");
    .....
}
```

Return Value If successful, it returns 0.

On error, it returns -1. The global variable *errno* is set to indicate the error condition encountered.

Remarks

This routine returns the name of the peer connected to socket *s*. It only can be used on a connected socket.

- ▶ *name* is a result parameter that is filled in with the address of the connecting entity, as known to the communications layer. The exact format of the parameter is determined by the address family in which the communication is occurring.
- ▶ *namelen* is a value-result parameter; it initially contains the amount of space pointed to by *name*; on return, it will contain the actual length, in bytes, of the address returned. *name* is truncated if the buffer provided is too small.

See Also connect, getsockname

getsockname

Purpose To get socket name.

Syntax **S16 getsockname (SOCKET *s*, struct sockaddr **name*, S16 **namelen*);**

Parameters

SOCKET <i>s</i>
Descriptor identifying a socket.
struct sockaddr <i>*name</i>
Pointer to a <i>sockaddr</i> structure receiving the local IP address and port number.
S16 <i>*namelen</i>
Pointer to an integer containing the length of name.

Example

```
SOCKET s;
struct sockaddr_in local_name;
int size_of_name;
.....
size_of_name = sizeof(local_name);
if (getsockname(s, (struct sockaddr*)&local_name, &size_of_name) < 0)
{
    printf("Can not get local name info");
    .....
}
```

Return Value

If successful, it returns 0.

On error, it returns -1. The global variable *errno* is set to indicate the error condition encountered.

Remarks

This routine returns the current name for bound or connected socket *s*. It is especially useful when a *connect()* call has been made without doing a *bind* first.

- ▶ *name* is a result parameter that is filled in with the address of the connecting entity, as known to the communications layer. The exact format of the parameter is determined by the address family in which the communication is occurring.
- ▶ *namelen* is a value-result parameter; it initially contains the amount of space pointed to by *name*; on return, it will contain the actual length, in bytes, of the address returned. *Name* is truncated if the buffer provided is too small.

See Also

bind, *connect*, *getpeername*

getsockopt

Purpose To get options on a socket.

Syntax **S16 getsockopt (SOCKET *s*, S16 *level*, S16 *optname*, S8 **optval*, S16 **optlen*);**

Parameters

SOCKET <i>s</i>	
Descriptor identifying a socket.	
S16 <i>level</i>	
Level at which the option resides: SOL_SOCKET, IPPROTO_TCP, or IPPROTO_IP	
S16 <i>optname</i>	
Socket option for which the value is to be retrieved.	
For example, the following options are recognized –	
▶ SOL_SOCKET	
SO_DEBUG	Enable recording of debugging information
SO_REUSEADDR	Enable local address reuse
SO_KEEPALIVE	Enable sending keep-alives
SO_DONTROUTE	Enable routing bypass for outgoing messages
SO_BROADCAST	Enable permission to transmit broadcast messages
SO_BINDTODEVICE	(...)
SO_LINGER	Return the current Linger option
SO_OOBINLINE	Enable reception of out-of-band data in band
SO_SNDBUF	Get buffer size for sends
SO_RCVBUF	Get buffer size for receives
SO_ERROR	Get and clear error on the socket
SO_TYPE	Get the type of the socket
▶ IPPROTO_TCP	
TCP_MAXSEG	Get TCP maximum-segment size
TCP_NODELAY	Disable the Nagle algorithm for send coalescing
▶ IPPROTO_IP	
IP_OPTIONS	Get IP header options
S8 <i>*optval</i>	
Pointer to a buffer where the value for the requested option is to be returned.	
S16 <i>*optlen</i>	
Pointer to an integer containing the size of the buffer, in bytes. On return, it will be set to the size of the value returned.	

Example	(. . .)
Return Value	<p>If successful, it returns 0.</p> <p>On error, it returns -1. The global variable <i>errno</i> is set to indicate the error condition encountered.</p>
Remarks	<p>This routine retrieves the current value for a socket option associated with a socket of any type, in any state, and stores the result in <i>optval</i>. Although options may exist at multiple protocol levels, they are always present at the uppermost socket level. Options affect socket operations, such as the packet routing and OOB data transfer.</p> <ul style="list-style-type: none">▶ To manipulate options at the socket level, level is specified as <i>SOL_SOCKET</i>.▶ To manipulate options at any other level, the protocol number of the appropriate protocol controlling the option is supplied.
See Also	setsockopt

inet_addr

Purpose	To convert an IP address string in standard dot notation to a network byte order unsigned long integer.
Syntax	U32 inet_addr (S8 *dotted);
Parameters	<div>S8 *dotted</div> <div>An IP address in standard dot notation to be converted.</div>
Example	<pre>struct sockaddr_in name; name.sin_addr .s_addr = inet_addr((char *)"192.168.1.1");</pre>
Return Value	It returns a value of conversion.
See Also	inet_ntoa

inet_ntoa

Purpose	To convert an IP address stored in <i>in_addr</i> structure to a string in standard dot notation.
Syntax	S8 *inet_ntoa (struct in_addr addr);
Parameters	<div>struct in_addr addr</div> <div>An <i>in_addr</i> structure containing the IP address to be converted.</div>
Example	<pre>struct sockaddr_in name; char ip_addr[16]; strcpy(ip_addr, inet_ntoa(name.sin_addr)); printf("Remote IP: %s", ip_addr);</pre>
Return Value	It returns a pointer to the string.
See Also	inet_addr

ioctlsocket

Purpose	To provide controls on the I/O mode of a socket.
Syntax	S16 ioctlsocket (S16 fildes, S16 request, ...);
Parameters	<div>S16 fildes</div> <div>Descriptor to open file.</div>
Example	(...)
Return Value	<p>If successful, it returns 0.</p> <p>On error, it returns -1. The global variable <i>errno</i> is set to indicate the error condition encountered.</p>
Remarks	<p>This routine manipulates the underlying device parameters of special files.</p> <ul style="list-style-type: none"> ▶ In particular, many operating characteristics of character special files may be controlled with <i>ioctlsocket</i>() requests.
See Also	fcntlsocket

listen	
Purpose	To listen for connections on a socket.
Syntax	S16 listen (SOCKET s, S16 backlog);
Parameters	SOCKET s
	Descriptor identifying a bound, unconnected socket.
	S16 backlog
	Number of connections that will be held in a queue waiting to be accepted.
Example	<pre> SOCKET s; struct sockaddr_in name; s = socket(PF_INET, SOCK_STREAM, TCP); if (s < 0) { printf("SOCKET allocation failed"); } memset(&name, 0, sizeof(name)); name.sin_family = AF_INET; name.sin_port = htons(3000); if (bind(s, (struct sockaddr*)&name, sizeof(name)) < 0) { printf("Error in Binding on socket: %d", s); } if (listen(s, 1) { printf("Error in Listening on socket: %d", s); } </pre>
Return Value	<p>If successful, it returns 0.</p> <p>On error, it returns -1. The global variable <i>errno</i> is set to indicate the error condition encountered.</p>
Remarks	<p>This routine is used with connection-oriented socket type <i>SOCK_STREAM</i>; it is part of the sequence of routines that are called to perform a passive open. <i>listen()</i> puts the bound socket in a state in which it is listening up to a backlog number of connection requests from clients.</p> <ul style="list-style-type: none"> ▶ The socket is put into passive open where incoming connection requests are acknowledged and queued pending acceptance by the <i>accept()</i> process. ▶ This routine is typically used by servers that can have more than one connection request at a time. If a connection request arrives and the queue is full, the client will receive an error. ▶ If there are no available socket descriptors, <i>listen()</i> attempts to continue to function. When descriptors become available, a later call to <i>listen()</i> or <i>accept()</i> will refill the queue to the current or most recent backlog, if possible, and resume listening for incoming connections.

- ▶ If `listen()` is called on an already listening socket, it will return success without changing the backlog. Setting the backlog to 0 in a subsequent call to `listen()` on a listening socket is not considered a proper reset, especially if there are connections on the socket.

See Also

`accept`, `connect`

recv					
Purpose	To receive data from a connected or bound socket.				
Syntax	S16 recv (SOCKET <i>s</i> , S8 <i>*buf</i> , S16 <i>len</i> , S16 <i>flags</i>);				
Parameters	SOCKET <i>s</i>				
	Descriptor identifying a connected socket.				
	S8 <i>*buf</i>				
	Pointer to a buffer where data is received.				
	S16 <i>len</i>				
	Maximum number of bytes to be received.				
	S16 <i>flags</i>				
	<table> <tr> <td>MSG_OOB</td><td>Receive urgent data (out-of-bound data).</td></tr> <tr> <td>MSG_PEEK</td><td>Receive data but do not remove it from the input queue, allowing it to be read again on subsequent calls (peek at incoming data).</td></tr> </table>	MSG_OOB	Receive urgent data (out-of-bound data).	MSG_PEEK	Receive data but do not remove it from the input queue, allowing it to be read again on subsequent calls (peek at incoming data).
MSG_OOB	Receive urgent data (out-of-bound data).				
MSG_PEEK	Receive data but do not remove it from the input queue, allowing it to be read again on subsequent calls (peek at incoming data).				
Example	<pre> SOCKET s; char buf[1024]; int len; if (socket_hasdata(s)) { len = recv(s, buf, sizeof(buf), 0); if (len < 0) { printf("recv fails on socket: %d", s); } } </pre>				
Return Value	<p>If successful, it returns a non-negative integer (≥ 0) indicating the number of bytes received and stored into buffer.</p> <p>On error, it returns -1. The global variable <i>errno</i> is set to indicate the error condition encountered.</p>				
Remarks	<p>This routine reads incoming data from a specified buffer (<i>buf</i>) on a connected socket.</p> <ul style="list-style-type: none"> ▶ <code>select()</code> may be used to determine when more data arrives. ▶ The application can avoid this blocking behavior by using <code>socket_hasdata()</code> to make sure there is data available before calling <code>recv()</code>. 				
See Also	<code>recvfrom</code> , <code>select</code> , <code>send</code> , <code>socket_hasdata</code>				

recvfrom

Purpose To receive data from a socket and stores the source address.

Syntax **S16** **recvfrom** (**SOCKET** *s*, **S8** **buf*, **S16** *len*, **S16** *flags*, **struct sockaddr** **from*, **S16** **fromlen*);

Parameters

SOCKET <i>s</i>	
Descriptor identifying a connected socket.	
S8 <i>*buf</i>	
Pointer to a buffer where data is received.	
S16 <i>len</i>	
Maximum number of bytes to be received.	
S16 <i>flags</i>	
MSG_OOB	Receive urgent data (out-of-bound data).
MSG_PEEK	Receive data but do not remove it from the input queue, allowing it to be read again on subsequent calls (peek at incoming data).
struct sockaddr <i>*from</i>	
Pointer to <i>sockaddr</i> structure that will hold the source address upon return.	
S16 <i>*fromlen</i>	
Pointer to an integer containing the length of <i>from</i> .	

Example (. . .)

Return Value If successful, it returns a non-negative integer (≥ 0) indicating the number of bytes received and stored into buffer.

On error, it returns -1. The global variable *errno* is set to indicate the error condition encountered.

Remarks This routine reads incoming data from a specified buffer (*buf*), and captures the address from which the data was sent. It is typically used on a connectionless socket.

- ▶ If *from* is not a null pointer, the source address of data is filled in.
- ▶ *fromlen* is a value-result argument, initialized to the size of the buffer associated with *from*, and modified on return to indicate the actual size of the address stored there.
- ▶ `select()` may be used to determine when more data arrives.
- ▶ The application can avoid this blocking behavior by using `socket_hasdata()` to make sure there is data available before calling `recvfrom()`.

See Also `recv`, `select`, `send`, `socket_hasdata`

select											
Purpose	To synchronize I/O multiplexing.										
Syntax	S16 select (S16 nfds, fd_set *readfds, fd_set *writefds, fd_set *exceptfds, struct timeval *timeout);										
Parameters	S16 nfds										
	Descriptor identifying a set of sockets to be checked - from 0 through nfds -1 in the descriptor sets are examined.										
	fd_set *readfds, *writefds, *exceptfds										
	Any of readfds, writefds, and exceptfds may be given as null pointers if no descriptors are of interest.										
	struct timeval *timeout										
	Pointer to a zero-valued <i>timeval</i> structure, specifies the maximum interval to wait for the selection to complete. <ul style="list-style-type: none">▶ System activity can lengthen the interval by an indeterminate amount.▶ If it is a null pointer, the select blocks indefinitely.										
Example	(. . .)										
Return Value	If successful, it returns the number of ready descriptors. If the time limit expires, it returns 0. On error, it returns -1. The global variable <i>errno</i> is set to indicate the error condition encountered.										
Remarks	<p>This routine examines the I/O descriptor sets whose addresses are passed in <i>readfds</i>, <i>writefds</i>, and <i>exceptfds</i> to see if some of their descriptors are ready for reading, are ready for writing, or have an exceptional condition pending, respectively.</p> <ul style="list-style-type: none">▶ The only exceptional condition detectable is out-of-band data received on a socket.▶ On return, this routine replaces the given descriptor sets with subsets consisting of those descriptors that are ready for the requested operation. It returns the total number of ready descriptors in all the sets. <p>The descriptor sets are stored as bit fields in arrays of integers.</p> <ul style="list-style-type: none">▶ The following are provided for manipulating such descriptor sets. Their behavior is undefined if a descriptor value is less than zero or greater than or equal to <i>FD_SETSIZE</i>, which is normally at least equal to the maximum number of descriptors supported by the system. <table><tr><td>FD_SETSIZE 8</td><td>The maximum number of descriptors is 8.</td></tr><tr><td>FD_SET (n, p)</td><td>((p) -> fds_bits [(n) >>3] = (1 << ((n) & 7)))</td></tr><tr><td>FD_CLR (n, p)</td><td>((p) -> fds_bits [(n) >>3] &= ~(1 << ((n) & 7)))</td></tr><tr><td>FD_ISSET (n, p)</td><td>((p) -> fds_bits [(n) >>3] & (1 << ((n) & 7)))</td></tr><tr><td>FD_ZERO (p)</td><td>memset ((void *) (p), 0, sizeof (*(p)))</td></tr></table>	FD_SETSIZE 8	The maximum number of descriptors is 8.	FD_SET (n, p)	((p) -> fds_bits [(n) >>3] = (1 << ((n) & 7)))	FD_CLR (n, p)	((p) -> fds_bits [(n) >>3] &= ~(1 << ((n) & 7)))	FD_ISSET (n, p)	((p) -> fds_bits [(n) >>3] & (1 << ((n) & 7)))	FD_ZERO (p)	memset ((void *) (p), 0, sizeof (*(p)))
FD_SETSIZE 8	The maximum number of descriptors is 8.										
FD_SET (n, p)	((p) -> fds_bits [(n) >>3] = (1 << ((n) & 7)))										
FD_CLR (n, p)	((p) -> fds_bits [(n) >>3] &= ~(1 << ((n) & 7)))										
FD_ISSET (n, p)	((p) -> fds_bits [(n) >>3] & (1 << ((n) & 7)))										
FD_ZERO (p)	memset ((void *) (p), 0, sizeof (*(p)))										
See Also	accept, connect, recv, send										

send

Purpose To send data to a connected socket.

Syntax **S16 send (SOCKET *s*, S8 **buf*, S16 *len*, S16 *flags*);**

Parameters

SOCKET <i>s</i>	
Descriptor identifying a connected socket.	
S8 *<i>buf</i>	
Pointer to a buffer where data is to be sent.	
S16 <i>len</i>	
Maximum number of bytes to be sent.	
S16 <i>flags</i>	
MSG_OOB	Send urgent data (out-of-bound data).
MSG_DONTROUTE	Send data using direct interface (bypass routing).

Example

```
SOCKET s;
char buf[1024];
int len, tlen;
.....
len = strlen(buf);
tlen = send(s, buf, len, 0);
if (tlen < 0) {
    printf("send fails on socket: %d", s);
    .....
}
```

Return Value If successful, it returns a non-negative integer (≥ 0) indicating the number of bytes sent.

On error, it returns -1. The global variable *errno* is set to indicate the error condition encountered.

Remarks This routine writes outgoing data to a specified send buffer (*buf*) on a connected socket.

- ▶ The whole data may not be sent at one time. Check the return value in case the send buffer overflows.
- ▶ The application can avoid this blocking behavior by using `socket_cansend()` to make sure there is data available before calling `send()`.

See Also `recv`, `sendto`, `socket_cansend`

sendto

Purpose To send data to a connected socket.

Syntax **S16 sendto (SOCKET *s*, S8 **buf*, S16 *len*, S16 *flags*, struct sockaddr **to*, S16 *tolen*);**

Parameters

SOCKET <i>s</i>	
Descriptor identifying a connected socket.	
S8 *<i>buf</i>	
Pointer to a buffer where data is to be sent.	
S16 <i>len</i>	
Maximum number of bytes to be sent.	
S16 <i>flags</i>	
MSG_OOB	Send urgent data (out-of-bound data).
MSG_DONTROUTE	Send data using direct interface (bypass routing).
struct sockaddr *<i>to</i>	
Pointer to <i>sockaddr</i> structure containing the address of the target socket.	
S16 <i>tolen</i>	
Length of address indicated by <i>to</i> .	

Example (. . .)

Return Value If successful, it returns a non-negative integer (≥ 0) indicating the number of bytes sent.

On error, it returns -1. The global variable *errno* is set to indicate the error condition encountered.

Remarks This routine writes outgoing data to a specified send buffer (*buf*) on a connected socket.

- ▶ The address of the target is given by *to* with *tolen* specifying its size. The length of the message is given by *len*. It is typically used on a connectionless socket.
- ▶ The whole data may not be sent at one time. Check the return value in case the send buffer overflows.
- ▶ The application can avoid this blocking behavior by using `socket_cansend()` to make sure there is data available before calling `send()`.

See Also `recvfrom`, `sendto`, `socket_cansend`

setsockopt

Purpose To set options on a socket.

Syntax **S16 setsockopt (SOCKET s, S16 level, S16 optname, S8 *optval, S16 *optlen);**

Parameters

SOCKET s	
Descriptor identifying a socket.	
S16 level	
Level at which the option resides: SOL_SOCKET, IPPROTO_TCP, or IPPROTO_IP	
S16 optname	
Socket option for which the value is to be set.	
For example, the following options are recognized -	
▶ SOL_SOCKET	
SO_DEBUG	Enable recording of debugging information
SO_REUSEADDR	Enable local address reuse
SO_KEEPALIVE	Enable sending keep-alives
SO_DONTROUTE	Enable routing bypass for outgoing messages
SO_BROADCAST	Enable permission to transmit broadcast messages
SO_BINDTODEVICE	(...)
SO_LINGER	Linger on close if unsent data is present
SO_OOBINLINE	Enable reception of out-of-band data in band
SO_SNDBUF	Set buffer size for sends
SO_RCVBUF	Set buffer size for receives
▶ IPPROTO_TCP	
TCP_NODELAY	Disable the Nagle algorithm for send coalescing
▶ IPPROTO_IP	
IP_OPTIONS	Set IP header options
S8 *optval	
Pointer to a buffer where the value for the option is specified.	
S16 *optlen	
Pointer to an integer containing the size of the buffer, in bytes.	

Example (. . .)

Return Value If successful, it returns 0.

On error, it returns -1. The global variable *errno* is set to indicate the error condition encountered.

Remarks This routine sets the current value for a socket option associated with a socket of any type, in any state. Although options may exist at multiple protocol levels, they are always present at the uppermost socket level. Options affect socket operations, such as the packet routing and OOB data transfer.

When manipulating socket options, the level at which the option resides and the name of the option must be specified.

- ▶ To manipulate options at the socket level, level is specified as *SOL_SOCKET*.
- ▶ To manipulate options at any other level, the protocol number of the appropriate protocol controlling the option is supplied.

See Also getsockopt

shutdown

Purpose To shut down part of a TCP connection.

Syntax **S16 shutdown (SOCKET *s*, S16 *how*);**

Parameters

SOCKET <i>s</i>	
Descriptor identifying a socket.	
S16 <i>how</i>	
0	Shut down receive data path
1	Shut down send data path and send FIN (final)
2	Shut down both receive and send data path

Example

```
SOCKET s;  
  
.....  
if (shutdown(s, 2) < 0) {  
    printf("shutdown fails on socket: %d", s);  
    .....  
}
```

Return Value If successful, it returns 0.

On error, it returns -1. The global variable *errno* is set to indicate the error condition encountered.

Remarks This routine shuts down part of a previously established TCP connection.

- ▶ Even if both receive and send data path are shut down, *closesocket()* must be called to actually close the socket.

See Also closesocket

socket

Purpose To create a socket that is bound to a specific service provider.

Syntax **SOCKET socket (S16 domain, S16 type, S16 protocol);**

Parameters	S16 domain		
	Protocol family; this should always be PF_INET or AF_INET.		
	S16 type, protocol		
	Depending on the socket type specified, the protocol to be used can be TCP or UDP.		
	<i>Type</i>	<i>Protocol</i>	
	SOCK_STREAM	6 (TCP)	Stream socket
		0	Do not check protocol
	SOCK_DGRAM	5 (UDP)	Datagram socket
		0	Do not check protocol

Example

```

SOCKET s;

s = socket(PF_INET, SOCK_STREAM, 6);
if (s < 0) {
printf("SOCKET allocation fails");
.....
}

```

Return Value If successful, it returns a non-negative integer (≥ 0) as a descriptor referencing the socket.

On error, it returns -1. The global variable *errno* is set to indicate the error condition encountered.

Remarks This routine creates an endpoint for communication and returns a descriptor.

- ▶ *domain* specifies a communications domain within which communication will take place; this selects the protocol family which should be used.
- ▶ The socket has the indicated *type*, which specifies the semantics of communication.
- ▶ *protocol* specifies a particular protocol to be used with the socket. Normally only a single protocol exists to support a particular socket type within a given protocol family. However, it is possible that many protocols may exist, in which case a particular protocol must be specified in this manner. The protocol number to use is particular to the "communication domain" in which communication is to take place.

See Also accept, bind, closesocket, connect, getpeername, getsockname, getsockopt, ioctlsocket, listen, recv, recvfrom, select, send, sendto, setsockopt, shutdown

2.3 BYTE SWAPPING

2.3.1 FUNCTIONS

htonl

Purpose	To convert an unsigned long integer from host byte order to network byte order.
Syntax	U16 htonl (U32 val);
Parameters	<div>U32 val</div> <div>An unsigned long integer to be converted.</div>
Example	(...)
Return Value	It returns the value of conversion.
See Also	ntohl

htons

Purpose	To convert an unsigned (short) integer from host byte order to network byte order.
Syntax	U16 htons (U16 val);
Parameters	<div>U16 val</div> <div>An unsigned integer to be converted.</div>
Example	<pre> struct sockaddr_in name; s = socket(PF_INET, SOCK_STREAM, TCP); if (s < 0) { printf("SOCKET allocation failed"); } memset(&name, 0, sizeof(name)); name.sin_family = AF_INET; name.sin_port = htons(3000); </pre>
Return Value	It returns the value of conversion.
See Also	ntohs

ntohl

Purpose	To convert an unsigned long integer from network byte order to host byte order.
Syntax	U16 ntohl (U32 val);
Parameters	<div>U32 val</div> <div>An unsigned long integer to be converted.</div>
Example	(...)
Return Value	It returns the value of conversion.
See Also	htonl

ntohs

Purpose To convert an unsigned (short) integer from network byte order to host byte order.

Syntax **U16 ntohs (U16 val);**

Parameters **U16 val**

An unsigned integer to be converted.

Example

```
struct sockaddr_in name;  
int port;  
  
.....  
port = ntohs(name.sin_port);  
printf("Remote Port: %d", port);
```

Return Value It returns the value of conversion.

See Also htons

2.4 SUPPLEMENTAL FUNCTIONS

Other useful functions for obtaining additional information or setting control for a connection are described below.

DNS_resolver

Purpose	To get the remote IP address by remote name.				
Syntax	S16 DNS_resolver (const S8 *remote_host, U8 *remote_ip);				
Parameters	<table><tr><td>const S8 *remote_host</td></tr><tr><td>Pointer to a buffer where the remote hostname is stored.</td></tr><tr><td>U8 *remote_ip</td></tr><tr><td>Pointer to a buffer where the remote host IP is returned.</td></tr></table>	const S8 *remote_host	Pointer to a buffer where the remote hostname is stored.	U8 *remote_ip	Pointer to a buffer where the remote host IP is returned.
const S8 *remote_host					
Pointer to a buffer where the remote hostname is stored.					
U8 *remote_ip					
Pointer to a buffer where the remote host IP is returned.					
Example	<pre>char IP[4]; DNS_resolver("www.cipherlab.com.tw", IP);</pre>				
Return Value	If successful, it returns 0. On error, it returns a negative value.				
Remarks	It is necessary to define the DNS server IP before calling this function.				
See Also	gethostbyname				

Nportno

Purpose	To get an ephemeral port number.
Syntax	S16 Nportno (void);
Example	<pre>if ((conno = Nopen(remote_ip, "TCP/IP", Nportno(), 2000, 0)) < 0) printf("Fail to connect Host: %s\r\n", remote_ip);</pre>
Return Value	It always returns the port number.
Remarks	This function generates a random local port number, which is used in a active open call to the Nopen() function.
See Also	Nopen

socket_block

Purpose	To set the connection for blocking operation.		
Syntax	S16 socket_block (S16 conno);		
Parameters	<table><tr><td>S16 conno</td></tr><tr><td>Connection number</td></tr></table>	S16 conno	Connection number
S16 conno			
Connection number			
Example	<code>socket_block(conno);</code>		
Return Value	If successful, it returns 0. On error, it returns -1.		
Remarks	<p>This function sets non-blocking operation back to blocking operation.</p> <ul style="list-style-type: none">▶ Blocking operation is the default behavior for network functions. When in blocking operation, calls to network functions will run to completion, or return a timeout error if an associated time limit is run out.		
See Also	<code>socket_noblock</code>		

socket_cansend

Purpose	To check if data can be sent immediately.				
Syntax	S16 socket_cansend (S16 <i>conno</i>, U16 <i>len</i>);				
Parameters	<table><tr><td>S16 <i>conno</i></td></tr><tr><td>Connection number</td></tr><tr><td>U16 <i>len</i></td></tr><tr><td>Number of bytes to write.</td></tr></table>	S16 <i>conno</i>	Connection number	U16 <i>len</i>	Number of bytes to write.
S16 <i>conno</i>					
Connection number					
U16 <i>len</i>					
Number of bytes to write.					
Example	<pre>if (socket_cansend(conno, strlen(buf))) Nwrite (conno, buf, strlen(buf));</pre>				
Return Value	If okay, it returns a non-zero value. Otherwise, it returns 0.				
See Also	Nwrite				

socket_fin

Purpose	To set the FIN flag on the next outgoing TCP segment.		
Syntax	S16 socket_fin (S16 <i>conno</i>);		
Parameters	<table><tr><td>S16 <i>conno</i></td></tr><tr><td>Connection number</td></tr></table>	S16 <i>conno</i>	Connection number
S16 <i>conno</i>			
Connection number			
Example	<pre>val = socket_fin(conno);</pre>		
Return Value	If successful, it returns 0. Otherwise, it returns -1.		
Remarks	<p>The next TCP segment to be written, following a call to this function, will have the FIN flag set in the TCP header.</p> <p>▶ This is useful for shutting down a connection at the same time that the last segment is sent. After that, call Nclose() to finish closing the connection.</p> <p>Note that Nclose() will not send a FIN segment in this case.</p>		
See Also	Nclose		

socket_hasdata

Purpose	To check if data is available to be read.		
Syntax	S16 socket_hasdata (S16 conno);		
Parameters	<table><tr><td>S16 conno</td></tr><tr><td>Connection number</td></tr></table>	S16 conno	Connection number
S16 conno			
Connection number			
Example	<pre>if (socket_hasdata(conno)) Nread(conno, buf, sizeof(buf));</pre>		
Return Value	If available, it returns a non-zero value. Otherwise, it returns 0.		
See Also	Nread, recv		

socket_ipaddr

Purpose	To get the IP address of the remote end of a connection.				
Syntax	S16 socket_ipaddr (S16 conno, U8 *ipaddr);				
Parameters	<table><tr><td>S16 conno</td></tr><tr><td>Connection number</td></tr><tr><td>U8 *ipaddr</td></tr><tr><td>Pointer to a buffer where the IP address is returned.</td></tr></table>	S16 conno	Connection number	U8 *ipaddr	Pointer to a buffer where the IP address is returned.
S16 conno					
Connection number					
U8 *ipaddr					
Pointer to a buffer where the IP address is returned.					
Example	<pre>unsigned char ip[4]; socket_ipaddr(conno, ip); printf("Remote IP: %d.%d.%d.%d\r\n", ip[0], ip[1], ip[2], ip[3]);</pre>				
Return Value	If successful, it returns 0. On error, it returns -1.				
Remarks	This function copies the remote host IP address of the connection specified by <i>conno</i> into a buffer indicated by <i>ipaddr</i> . No string terminator is appended by this function.				
See Also	getpeername				

socket_isopen

Purpose	To check if the remote end of a connection is open.		
Syntax	S16 socket_isopen (S16 <i>conno</i>);		
Parameters	<table><tr><td>S16 <i>conno</i></td></tr><tr><td>Connection number</td></tr></table>	S16 <i>conno</i>	Connection number
S16 <i>conno</i>			
Connection number			
Example	<pre>if (socket_isopen(conno)) printf("connected!!");</pre>		
Return Value	If connected, it returns a non-zero value. Otherwise, it returns 0.		
Remarks	This function checks if the remote end has entered the ESTABLISHED state. (TCP only)		
See Also	Nopen		

socket_keepalive

Purpose	To set the dummy sending period for a connection.				
Syntax	S16 socket_keepalive (S16 <i>conno</i>, U32 <i>val</i>);				
Parameters	<table><tr><td>S16 <i>conno</i></td></tr><tr><td>Connection number</td></tr><tr><td>U32 <i>val</i></td></tr><tr><td>Dummy sending period given in milli-second. ▶ Set to 0 to disable dummy sending.</td></tr></table>	S16 <i>conno</i>	Connection number	U32 <i>val</i>	Dummy sending period given in milli-second. ▶ Set to 0 to disable dummy sending.
S16 <i>conno</i>					
Connection number					
U32 <i>val</i>					
Dummy sending period given in milli-second. ▶ Set to 0 to disable dummy sending.					
Example	<pre>val = socket_keepalive(conno, p);</pre>				
Return Value	It returns 0.				
Remarks	In some special application, the remote end will auto-disconnect if it never receives any packet in a certain period of time. This function will send an empty packet to the remote end to avoid such problem. (TCP only)				

socket_noblock

Purpose	To set the connection for non-blocking operation.		
Syntax	S16 socket_noblock (S16 conno);		
Parameters	<table><tr><td>S16 conno</td></tr><tr><td>Connection number</td></tr></table>	S16 conno	Connection number
S16 conno			
Connection number			
Example	<code>socket_noblock(conno);</code>		
Return Value	If successful, it returns 0. On error, it returns -1.		
Remarks	This function sets non-blocking operation. When in non-blocking operation, calls to network functions, which normally have to wait for network activity to be completed, will return the negative value <i>EWOULDBLOCK</i> when such a condition is encountered.		
See Also	<code>socket_block</code>		

socket_push

Purpose	To set the PSH flag on the next outgoing TCP segment.		
Syntax	S16 socket_push (S16 conno);		
Parameters	<table><tr><td>S16 conno</td></tr><tr><td>Connection number</td></tr></table>	S16 conno	Connection number
S16 conno			
Connection number			
Example	<pre>val = socket_push(conno);</pre>		
Return Value	If successful, it returns 0. Otherwise, it returns -1.		
Remarks	<p>The next TCP segment to be written, following a call to this function, will have the PSH flag set in the TCP header.</p> <ul style="list-style-type: none">▶ This is useful for indicating to the TCP on the remote system that all internally buffered segments up through this segment should be delivered to the application as soon as possible.		
See Also	socket_fin		

socket_rxstat

Purpose	To get the receive status for a connection.																		
Syntax	S16 socket_rxstat (S16 conno);																		
Parameters	<table><tr><td>S16 conno</td></tr><tr><td>Connection number</td></tr></table>	S16 conno	Connection number																
S16 conno																			
Connection number																			
Example	<pre>val = socket_rxstat(conno);</pre>																		
Return Value	<table><tr><th colspan="2">Return Value</th><th></th></tr><tr><td>0x01</td><td>S_EOF</td><td>FIN has been received.</td></tr><tr><td>0x02</td><td>S_UNREA</td><td>Destination unreachable ICMP.</td></tr><tr><td>0x04</td><td>S_FATAL</td><td>Fatal error.</td></tr><tr><td>0x08</td><td>S_RST</td><td>Restart message received.</td></tr><tr><td>0x10</td><td>S_SHUTRCV</td><td>Receive has been shutdown (active, not by receiving FIN).</td></tr></table>	Return Value			0x01	S_EOF	FIN has been received.	0x02	S_UNREA	Destination unreachable ICMP.	0x04	S_FATAL	Fatal error.	0x08	S_RST	Restart message received.	0x10	S_SHUTRCV	Receive has been shutdown (active, not by receiving FIN).
Return Value																			
0x01	S_EOF	FIN has been received.																	
0x02	S_UNREA	Destination unreachable ICMP.																	
0x04	S_FATAL	Fatal error.																	
0x08	S_RST	Restart message received.																	
0x10	S_SHUTRCV	Receive has been shutdown (active, not by receiving FIN).																	
See Also	socket_txstat																		

socket_rxtout

Purpose	To set the receive timeout for a connection.				
Syntax	S16 socket_rxtout (S16 <i>conno</i>, U32 <i>val</i>);				
Parameters	<table><tr><td>S16 <i>conno</i></td></tr><tr><td>Connection number</td></tr><tr><td>U32 <i>val</i></td></tr><tr><td>Time interval given in milli-second.</td></tr></table>	S16 <i>conno</i>	Connection number	U32 <i>val</i>	Time interval given in milli-second.
S16 <i>conno</i>					
Connection number					
U32 <i>val</i>					
Time interval given in milli-second.					
Example	<pre>val = socket_rxtout(conno, timeout);</pre>				
Return Value	<p>If successful, it returns 0.</p> <p>On error, it returns -1. The global variable <i>errno</i> is set to indicate the error condition encountered. Refer to the header files for error codes.</p>				

socket_state

Purpose	To get the socket status for a connection.																				
Syntax	S8 socket_state (S16 conno);																				
Parameters	<table><tr><td colspan="3">S16 conno</td></tr><tr><td colspan="3">Connection number</td></tr></table>			S16 conno			Connection number														
S16 conno																					
Connection number																					
Example	<pre>val = socket_state(conno);</pre>																				
Return Value	<table><tr><td colspan="3"><i>Return Value</i></td></tr><tr><td>1</td><td>ESTABLISHED</td><td></td></tr><tr><td>2</td><td>SYN_SENT</td><td></td></tr><tr><td>3</td><td>SYN_RECEIVED</td><td></td></tr><tr><td>4</td><td>LISTEN</td><td></td></tr><tr><td>5</td><td>CLOSING</td><td></td></tr></table>			<i>Return Value</i>			1	ESTABLISHED		2	SYN_SENT		3	SYN_RECEIVED		4	LISTEN		5	CLOSING	
<i>Return Value</i>																					
1	ESTABLISHED																				
2	SYN_SENT																				
3	SYN_RECEIVED																				
4	LISTEN																				
5	CLOSING																				
See Also	socket_rxstat, socket_txstat																				

socket_testfin

Purpose	To check if the remote end has closed the connection. (TCP only)		
Syntax	S16 socket_testfin (S16 conno);		
Parameters	<table><tr><td>S16 conno</td></tr><tr><td>Connection number</td></tr></table>	S16 conno	Connection number
S16 conno			
Connection number			
Example	<code>if (socket_testfin(conno)) Nclose(conno);</code>		
Return Value	If closed, it returns a non-zero value. Otherwise, it returns 0.		
See Also	Nclose		

socket_txstat

Purpose To get the transmit status for a connection.

Syntax **S16 socket_txstat (S16 conno);**

Parameters

S16 conno
Connection number

Example `val = socket_txstat(conno);`

Return Value		
0x01	S_PSH	Push
0x08	S_FIN_SENT	FIN has been sent.
0x10	S_FIN_ACKED	My FIN has been ACKED.
0x20	S_PASSIVEOPEN	Originally a passive open. (for simultaneous active open)

See Also `socket_rxstat`

WIRELESS NETWORKING

This section describes the functions related to wireless network configuration. These functions are only applicable to the mobile computers according to their hardware configuration. Refer to [Appendix III — Examples](#).

- ▶ WLAN stands for IEEE 802.11b/g/n
- ▶ SPP stands for Serial Port Profile of Bluetooth
- ▶ DUN stands for Dial-Up Networking Profile of Bluetooth for connecting a modem
- ▶ DUN-GPRS stands for Dial-Up Networking Profile of Bluetooth for activating a mobile's GPRS
- ▶ HID stands for Human Interface Device Profile of Bluetooth

Mobile Computer	8600	8630	8660
Bluetooth	-	√	√
WLAN (802.11b/g/n)	-	√	-

IN THIS CHAPTER

3.1 Network Configuration	54
3.2 Initialization & Termination	56
3.3 Network Status.....	59

3.1 NETWORK CONFIGURATION

Before bringing up (initializing) the network, some related parameters must be configured. These parameters are grouped into a structure, **NETCONFIG** or **BTCONFIG** or **PPPCONFIG** structure, and are saved in the system. They are kept by the system during normal operations and power on/off cycles.

Refer to [Appendix I — Net Parameters by Index](#).

3.1.1 IMPLEMENTATION

These parameters can be accessed through System Menu or an application program (via **GetNetParameter**, **SetNetParameter**, and some specific routines as shown below).

Note: The parameters will be set back to the default values when updating kernel.

3.1.2 FUNCTIONS

GetNetParameter

Purpose	To retrieve one networking configuration item from the system.
Syntax	void GetNetParameter (void *return-value, S16 index);
Parameters	See Appendix I — Net Parameters by Index.
Example	<pre> S32 DhcpEnable; unsigned char IP[4]; DhcpEnable = 1; SetNetParameter((void*)&DhcpEnable, P_DHCP_ENABLE); if (NetInit() < 0) { printf("Initialization Fail"); } while (CheckNetStatus(NET_IPReady) != 1) OSTimeDly(5); GetNetParameter((void*)&IP, P_LOCAL_IP); printf("IP = %d.%d.%d.%d", IP[0], IP[1], IP[2], IP[3]); </pre>
Return Value	None
Remarks	<p>This routine gets one network configuration item from the system.</p> <ul style="list-style-type: none"> ▶ Make sure the size of return-value is suitable to the configuration type.

SetNetParameter

Purpose	To write one networking configuration item to the system.
Syntax	void SetNetParameter (void *setting, S16 index);
Parameters	See Appendix I — Net Parameters by Index.
Example	<pre> S32 DhcpEnable; U8 IP[4]; DhcpEnable = 1; SetNetParameter((void*)&DhcpEnable, P_DHCP_ENABLE); if (NetInit() < 0) { printf("Initialization Fail"); } while (CheckNetStatus(NET_IPReady) != 1) OSTimeDly(5); GetNetParameter((void*)&IP, P_LOCAL_IP); printf("IP = %d.%d.%d.%d", IP[0], IP[1], IP[2], IP[3]); </pre>
Return Value	None
Remarks	<p>This routine writes one network configuration item to the system.</p> <ul style="list-style-type: none"> ► Use NetInit() to initialize networking according to the configurations written.

3.2 INITIALIZATION & TERMINATION

After the networking parameters are properly configured, an application program can call **NetInit()** to initialize any wireless module (802.11b/g/n, Bluetooth, or GSM/GPRS) and networking protocol stack.

- ▶ The wireless modules will not be powered until **NetInit()** is called.
- ▶ When an application program needs to stop using the network, **NetClose()** must be called to shut down the network as well as the modules (so that power can be saved). To enable the network again, **NetInit()** must be called again.

Note: Any previous network connection and data will be lost after calling NetClose().

3.2.1 OVERVIEW

8630	NetInit(0L)	Enables 802.11b/g/n (WLAN)
	NetInit(3L)	Enables mobile's GPRS functionality via Bluetooth (DUN)
8660	NetInit(3L)	Enables mobile's GPRS functionality via Bluetooth (DUN)

3.2.2 FUNCTIONS

NetInit

Purpose To initialize networking.

Syntax **S16 NetInit (U32 mode);**

Parameters

U32 mode		
0L	WLAN_NETWORKING	Enable 802.11b/g/n (WLAN)
1L	BLUETOOTH_NETWORKING	Reserved
3L	BT_GPRS_NETWORKING	Enable mobile's GPRS functionality via Bluetooth (DUN)
4L	CRADLE_PPP_NETWORKING	Enable PPP connection via Modem Cradle
5L	RS232_PPP_NETWORKING	Enable PPP connection via direct RS-232 (to a generic modem)
6L	CRADLE_MODE_NETWORKING	Enable Ethernet connection via Ethernet Cradle
7L	GPRS_CRADLE_NETWORKING	Enable GPRS connection via GPRS Cradle

Example	<pre>struct NETSTATUS ns; if (NetInit() < 0) { printf("Initialization Fail"); } while (CheckNetStatus(NET_IPReady) != 1) OSTimeDly(5);</pre>
Return Value	<p>If successful, it returns 0.</p> <p>On error, it returns -1. (Usually it is caused by hardware problems.)</p>
Remarks	<p>This routine initializes the wireless module and TCP/IP networking protocol stack. Some part of the initialization is done in a background system task. When this routine returns, the initialization process might not yet been done.</p> <ul style="list-style-type: none">▶ It is necessary for the application to check the status of <i>IPReady</i> (see <i>NetStatus</i>) before performing any networking operations.
See Also	CheckNetStatus, NetClose

NetClose	
-----------------	--

Purpose	To close network connections.
Syntax	S16 NetClose (void);
Example	<code>val = NetClose();</code>
Return Value	It returns 0.
Remarks	This routine closes network connections. ▶ Networking can be restarted by calling NetInit().
See Also	NetInit

3.3 NETWORK STATUS

Once networking has been initialized, information on networking status can be retrieved from the system. This status information is grouped into a structure, **NETSTATUS** or **RADIOSTATUS** or **BTSTATUS**, and the system will periodically update it.

User program must explicitly call **CheckNetStatus()** to get the latest status. Refer to [Appendix III — Net Status by Index](#).

3.3.1 FUNCTIONS

CheckNetStatus

Purpose To check on networking status from the system.

Syntax **S16 CheckNetStatus (S16 index);**

Parameters See Appendix III — Net Status by Index.

Example

```
S32 DhcpEnable;
U8 IP[4];
.....

DhcpEnable = 1;
SetNetParameter((void*)&DhcpEnable, P_DHCP_ENABLE);

if (NetInit() < 0) {
    printf("Initialization Fail");
    .....
}

while (!CheckNetStatus(NET_IPReady)) OSTimeDly(10);

GetNetParameter((void*)&IP, P_LOCAL_IP);
printf("IP = %d.%d.%d.%d", IP[0], IP[1], IP[2], IP[3]);
```

Return Value See values listed in NETSTATUS, RADIOSTATUS, BTSTATUS, and GSMSTATUS structures.

See Also GetBTStatus, GetNetStatus

3.4 WISPR LIBRARY

The CL-WISPr library assists programmers in developing applications that can have the 8600 mobile computer automatically log in to a Wi-Fi hotspot. In practical terms, users may visit premises equipped with Wi-Fi hotspots belonging to different WISPs. Consequently, users have to manually log in to the hotspot when they attempt to connect to Internet. Applications designed with the CL-WISPr library routines can help users get rid of the hassle of login processes.

3.4.1 STRUCTURE

WISPrHandle

Purpose WISPr handler is used to save the WISPr authentication status, login URL, and logoff URL after initial request and login processes.

Syntax

```
typedef struct
{
    int authState;
    char loginURL[1024];
    char loginURL[1024];
} WISPrHandle;
```

Parameters States of the WISPr authentication (**int** *authState*) are as follows:

Name	Value	Description
WISPR_AUTH_STATE_NONE	0x01	Initial state or after successful logoff
WISPR_AUTH_STATE_WAIT	0x02	After first request, waiting for login
WISPR_AUTH_STATE_PASSED	0x03	Login authentication passed
WISPR_AUTH_STATE_BYPASS	0x04	No need to perform WISPr authentication because Internet connection has been established

WISPrLoginReq

Purpose The ID and password for login authentication will be stored in the structure.

Syntax

```
typedef struct
{
    char id[128];
    char pw[128];
} WISPrLoginReq;
```

3.4.2 METHOD

WISPr_Request

Purpose	Initialize a request to an arbitrary URL.
Syntax	<pre>int WISPr_Request(WISPrHandle *wisprHdl, char *reqURL, int *errCode);</pre>
Parameter	<p>WISPrHandle *wisprHdl</p> <p>The WISPr handle stores state and login/logoff URL. Success in request will get the login URL.</p> <p>char *reqURL</p> <p>The arbitrary URL. Input "Null" to use default URL.</p> <p>int *errCode</p> <p>Return the WISPr error code. Further details please refer to 3.4.4 WISPr Error Code.</p>
Example	<pre>WISPrHandle wisprHdl; int error = 0; memset(&wisprHdl, 0, sizeof(wisprHdl)); if (WISPr_Request(&wisprHdl, NULL, &error) == WISPR_STATUS_OK){ if (wisprHdl.authState == WISPR_AUTH_STATE_BYPASS) printf("Already Connected...\r\n"); if (wisprHdl.authState == WISPR_AUTH_STATE_WAIT){ printf("login URL:[%s]\r\n", wisprHdl.loginURL); } } else { printf("WISPr not supported\r\n"); }</pre>
Return Value	<p>If successful, it returns WISPR_STATUS_OK = 0.</p> <p>If network unreachable, it returns WISPR_NO_CONNECTION = -10.</p> <p>Otherwise, it returns WISPR_STATUS_ERROR = -1.</p>
Remarks	<p>The requested URL must be valid and reachable.</p> <p>Success in request will get the <WISPAccessGatewayParam> XML in the captive portal page; otherwise, this hotspot won't be WISPr-capable.</p>
See Also	WISPr_Login, WISPr_Logoff

WISPr_Login	
Purpose	WISPr login.
Syntax	<pre>int WISPr_Login(WISPrHandle *<i>wisprHdl</i>, WISPrLoginReq *<i>wisprLoginReq</i>, int *<i>errCode</i>);</pre>
Parameter	<p>WISPrHandle *<i>wisprHdl</i></p> <p>The WISPr handle stores state and login/logoff URL. Success in login will get the logoff URL.</p> <p>WISPrLoginReq *<i>wisprLoginReq</i></p> <p>ID and password for authentication.</p> <p>int *<i>errCode</i></p> <p>Return the WISPr error code. Further details please refer to 3.4.4 WISPr Error Code.</p>
Example	<pre>/* call WISPr_Request to get the login URL */ WISPrLoginReq wisprLoginCre; strcpy(wisprLoginCre.id, "0911654321@emome.net"); strcpy(wisprLoginCre.pw, "12345678"); if (WISPr_Login(&wisprHdl, &wisprLoginCre, &error) == WISPR_STATUS_OK) { printf("Logoff URL:[%s]...\r\n", wisprHdl.logoffURL); } else { printf("Login Failed...\r\n"); }</pre>
Return Value	<p>If successful, it returns WISPR_STATUS_OK = 0.</p> <p>If network unreachable, it returns WISPR_NO_CONNECTION = -10.</p> <p>Otherwise, it returns WISPR_STATUS_ERROR = -1.</p>
Remarks	The ID format may vary depending on the WIFI provider system in different countries.
See Also	WISPr_Request, WISPr_Logoff

WISPr_Logoff

Purpose WISPr logoff.

Syntax **int WISPr_Logoff(WISPrHandle *wisprHdl,**
int *errCode);

Parameter **WISPrHandle *wisprHdl**

The WISPr handle stores state and login/logoff URL.

int *errCode

Return the WISPr error code. Further details please refer to [3.4.4 WISPr Error Code](#).

Example

```
/* call WISPr_Login to get the logoff URL */
if (WISPr_Logoff(&wisprHdl, &error) == WISPR_STATUS_OK) {
    printf("Logoff OK\r\n");
} else {
    printf("Logoff Failed...\r\n");
}
```

Return Value If successful, it returns WISPR_STATUS_OK = 0.

If network unreachable, it returns WISPR_NO_CONNECTION = -10.

Otherwise, it returns WISPR_STATUS_ERROR = -1.

See Also WISPr_Request, WISPr_Login

3.4.3 CUSTOMIZED METHOD

US_McDonalds

Purpose	Customized method to connect to McDonald's free Wi-Fi in the U.S.
Syntax	INT US_McDonalds()
Example	<pre>if (!US_McDonalds()) printf("Agreement Passed\r\n"); else printf("Agreement Failed\r\n");</pre>
Return Value	If successful, it returns WISPR_STATUS_OK = 0. If network unreachable, it returns WISPR_NO_CONNECTION = -10. Otherwise, it returns WISPR_STATUS_ERROR = -1.
Remarks	Only available for McDonald's free Wi-Fi. It might be invalid if the system of Wi-Fi provider changes.
See Also	US_BurgerKing, US_Starbucks

US_BurgerKing

Purpose	Customized method to connect to Burger King's free Wi-Fi in the U.S.
Syntax	INT US_BurgerKing()
Example	<pre>if (!US_BurgerKing()) printf("Agreement Passed\r\n"); else printf("Agreement Failed\r\n");</pre>
Return Value	If successful, it returns WISPR_STATUS_OK = 0. If network unreachable, it returns WISPR_NO_CONNECTION = -10. Otherwise, it returns WISPR_STATUS_ERROR = -1.
Remarks	Only available for Burger King's free Wi-Fi. It might be invalid if the system of Wi-Fi provider changes.
See Also	US_McDonalds, US_Starbucks

US_Starbucks

Purpose	Customized method to connect to Starbucks free Wi-Fi in the U.S.
Syntax	INT US_Starbucks()
Example	<pre>if (!US_Starbucks()) printf("Agreement Passed\r\n"); else printf("Agreement Failed\r\n");</pre>

Return Value	If successful, it returns WISPR_STATUS_OK = 0. If network unreachable, it returns WISPR_NO_CONNECTION = -10. Otherwise, it returns WISPR_STATUS_ERROR = -1.
Remarks	Only available for Starbucks free Wi-Fi. It might be invalid if the system of Wi-Fi provider changes.
See Also	US_McDonalds, US_BurgerKing

3.4.4 WISPR ERROR CODE

Name	Value	Meaning
WISPR_SERVER_INTERNAL_ERROR	-20	Access gateway internal error
WISPR_SERVER_PROTOCOL_ERROR	-21	Network Administrator Error: Does not have RADIUS enabled
WISPR_SERVER_TIMEOUT	-22	RADIUS server error/timeout
WISPR_SERVER_REJECT	-23	Login failed (Access REJECT) or Authentication pending

IEEE 802.11B/G/N

IEEE 802.11b/g/n is an industrial standard for Wireless Local Area Networking (WLAN), which enables wireless communications over a long distance. The speed of connection between two wireless devices will vary with range and signal quality.

To maintain a reliable connection, the data rate of the 802.11b/g/n system will automatically fallback as range increases or signal quality decreases.

802.11 Specification	
Frequency Range:	2.4 GHz
Data Rate:	802.11b - 1, 2, 5.5, 11 Mbps 802.11g - 6, 9, 12, 18, 24, 36, 48, 54 Mbps 802.11n - 6.5, 13, 19.5, 26, 39, 52, 58.5, 65 Mbps
Connected Devices:	1 for ad-hoc mode (No AP) Multiple for infrastructure mode (AP required)
Protocol:	IP/TCP/UDP
Max. Output Power:	100 mW
Spread Spectrum:	DSSS/OFDM
Modulation:	802.11b - DBPSK, DQPSK, CCK 802.11g - BPSK, QPSK, 16-QAM, 64-QAM 802.11n - BPSK, QPSK, 16-QAM, 64-QAM
Standard:	IEEE 802.11b/g/n, interoperable with Wi-Fi devices

Note: All specifications are subject to change without prior notice.

IN THIS CHAPTER

4.1 Structure	68
4.2 Functions	79

4.1 STRUCTURE

4.1.1 NETCONFIG STRUCTURE

Use **GetNetParameter()** and **SetNetParameter()** to change the settings by index. Refer to [Appendix I — Net Parameters by Index](#).

```
struct NETCONFIG {  
    S16 DhcpEnable;  
    U8 IpAddr[4];  
    U8 SubnetMask[4];  
    U8 DefaultGateway[4];  
    U8 DnsServer[4];  
    S8 DomainName[129];  
    S8 LocalName[33];  
    S8 SSID[33];  
    S16 SystemScale;  
    WLAN_FLAG Flag;  
    S16 WepLen;  
    S16 DefaultKey;  
    U8 WepKey[4][14];  
    S8 EapID[33];  
    S8 EapPassword[33];  
    S8 WPA passphrase[64];  
    U8 WPApmk[32];  
    U8 WPAchk[2];  
    U8 CurrentBSSID[6];  
    U8 FixedBSSID[6];  
    S16 iRoamingTxLimit_11b;  
    S16 iRoamingTxLimit_11g;  
    S16 RssiThreshold;  
    S16 RssiDelta;  
    S16 RoamingPeriod;  
    S8 ReservedByte[54];  
};
```

Parameter	Default	Description	Index
S16 DhcpEnable	1	0: disable DHCP 1: enable DHCP	11
U8 IpAddr[4]	0.0.0.0	Local IP Address	1
U8 SubnetMask[4]	0.0.0.0	Subnet Mask	2
U8 DefaultGateway[4]	0.0.0.0	IP address of Default Gateway or router	3
U8 DnsServer[4]	0.0.0.0	IP address of DNS server	4
S8 DomainName[129]	Null	Domain Name (Read only)	16
S8 LocalName[33]	S/N	Local hostname. By default, it shows the serial number of mobile computer.	5
S8 SSID[33]	Null	Service Set ID or AP name, which is used for Remote Device association.	6
S16 SystemScale	2	Access Point Density, determines when the mobile computer should look for another AP that has better signal strength. 1: Low – SNR<20dB && RSSI<-75dBm 2: Medium – SNR<20dB && RSSI<-70dBm 3: High – SNR<25dB && RSSI<-70dBm 4: Custom – Tx Rate only 5. Custom – RSSI only	14
WLAN_FLAG Flag	0x19	See <i>WLAN_FLAG</i> Structure	12, 17, 18, 21, 22, 30, 33, 39
S16 WepLen	1	0: 64 bits Wep Key (5 bytes to be configured for the WepKey parameter) 1: 128 bits Wep Key (13 bytes to be configured for the WepKey parameter)	13
S16 DefaultKey	0	Use default Wep Key 0	15
U8 WepKey[4][14]	Null	WEP Key 0 ~ 3	7-10
S8 EapID[33]	Null	ID used to associate to Cisco® APs	19
S8 EapPassword[33]	Null	Password used to associate to Cisco® APs	20
S8 WPAPassphrase[64]	Null	WPA-PSK, WPA2-PSK (Pre-Shared Key mode) — Passphrase to access the network: 8~63 characters	34
U8 WPApmk[32]	Null	Stored Pre-Shared Key, generated based on SSID and Passphrase	---

Parameter	Default	Description	Index
U8 WPAchk[2]	Null	Checksum to detect if any changes made to SSID or Passphrase. (If yes, the Pre-Shared Key will be re-generated.)	---
U8 CurrentBSSID[6]	Null	Current Basic Service Set ID	35
U8 FixedBSSID[6]	Null	Use AP's MAC address as current Basic Service Set ID	36
S16 iRoamingTxLimit_11b	2	This parameter only works with "customized" system scale. Roaming starts when the data transmission rate gets lower than the specified value. 1: 1 Mbps 2: 2 Mbps 4: 5.5 Mbps 8: 11 Mbps	37
S16 iRoamingTxLimit_11g	8	This parameter only works with "customized" system scale. Roaming starts when the data transmission rate gets lower than the specified value. 1: 1 Mbps 2: 2 Mbps 4: 5.5 Mbps 8: 11 Mbps 16: 6 Mbps 32: 9 Mbps 48: 12 Mbps 64: 18 Mbps 80: 24 Mbps 96: 36 Mbps 112: 48 Mbps 128: 54 Mbps	38
S16 RssiThreshold	-70	Specify this parameter as the RSSI threshold ranging from -50 to -90 dBm. With the SystemScale set to 5, the mobile computer will search for another AP with better signal strength when RSSI of the current AP is lower than this parameter.	91
S16 RssiDelta	5	When a new AP is found, the mobile computer will connect to the new AP if the RSSI defferential between the two APs is equal to or higher than the specified RssiDelta that can be set ranging from 0 to 20.	92

S16 RoamingPeriod	5	This parameter, ranging from 3 to 10 in seconds, determines the time interval between two searches for another AP.	93
S8 ReservedByte[293]	Null	Reserved	

4.1.2 WLAN_FLAG STRUCTURE

```
typedef struct {  
    U16 Reservedflag: 6;  
    U16 ScanTime: 1;  
    U16 WPA2_PSK: 1;  
    U16 WPA_PSK: 1;  
    U16 AdHoc: 1;  
    U16 Preamble: 2;  
    U16 PWRSave: 1;  
    U16 Eap: 1;  
    U16 Wep: 1;  
    U16 Authen: 1;  
} WLAN_FLAG;
```

Parameter	Bit	Default	Description	Index
U16 Authen	0	1	0: Share Key 1: Open System	12
U16 Wep	1	0	0: WEP Key disable 1: WEP Key enable	17
U16 Eap	2	0	0: EAP disable 1: EAP enable	18
U16 PWRSave	3	1	0: Power-saving disable 1: Power-saving enable	21
U16 Preamble	4-5	1	0: reserved 1: long preamble 2: short preamble 3: both	22
U16 AdHoc	6	0	Ad-hoc mode 0: disable 1: enable	30
U16 WPA_PSK	7	0	0: WPA-PSK disable 1: WPA-PSK enable	33
U16 WPA2_PSK	8	0	0: WPA2-PSK disable 1: WPA2-PSK enable	39
U16 ScanTime	9	0	0: WIFI Scan Time Normal 1: WIFI Scan Time Double	48
U16 Reservedflag	10-15	0	Reserved	

4.1.3 NETSTATUS STRUCTURE

User program must explicitly call **CheckNetStatus()** to get the latest status. Refer to [Appendix III — Net Status by Index](#).

```
struct NETSTATUS {
    S16 State;
    S16 Reserve[3];
    S16 Channel;
    S16 TxRate;
    S16 IPReady;
};
```

Parameter	Description	Value				Index
S16 State	Connection State	0	NET_DISCONNECTED			0
		1	NET_CONNECTED			
S16 Channel	Current Channel Number	1 ~ 11				4
S16 TxRate	Current Transmit Rate	802.11b/g		802.11n		5
		1	1 Mbps	257	MCS 0	
		2	2 Mbps	258	MCS 1	
		4	5.5 Mbps	260	MCS 2	
		8	11 Mbps	264	MCS 3	
		16	6 Mbps	268	MCS 4	
		32	9 Mbps	272	MCS 5	
		48	12 Mbps	288	MCS 6	
		64	18 Mbps	304	MCS 7	
		80	24 Mbps			
		96	36 Mbps			
		112	48 Mbps			
		128	54 Mbps			
S16 IPReady	Mobile Computer – IP Status for both WLAN and Bluetooth	-1	Error ^{Note}			6
		0	Not Ready			
		1	Ready			

Note: If CheckNetStatus(IPReady) returns -1, it means an abnormal break occurs during PPP, DUN-GPRS, or GPRS connection. Such disconnection may be caused by the mobile computer being out of range, improperly turned off, etc.

4.1.4 RADIOSTATUS STRUCTURE

User program must explicitly call **ChecRadioStatus()** to get the latest status. Refer to [Appendix II — Net Status by Index](#).

```
struct RADIOSTATUS {  
    S16 SNR;  
    S16 RSSI;  
    S16 NoiseFloor;  
};
```

Parameter	Description	Value		Index
S16 SNR	Signal to Noise ratio (dB)	0 ~ 20	Poor	14
		20 ~ 30	Fair	
		30 ~ 40	Good	
		over 40	Very good	
S16 RSSI	Received Signal Strength Indication (dBm)	0 ~ -60	Strong	15
		-60 ~ -75	Moderate	
		< -75	Weak	
S16 NoiseFloor	Noise Floor (dBm)	0 ~ -92	High noise	16
		-92 ~ -95	Moderate	
		< -95	Low noise	

4.1.5 WI-FI HOTSPOT SEARCH STRUCTURE

This structure is provided for the mobile computer to scan for the Wi-Fi hotspots within range.

The user program must exactly call **WIFIScan(WifiDev *APList, S32 Count)** to get the Wi-Fi hotspot.

```
typedef struct {
    U8 SSID[32];

    U8 BSSID[6];    //MACID of WIFI device

    S8 Rssi;          //dBm

    U8 Channel;

    U8 BandType;    // 10: 802.11b/g/n or n only
                   //  2: 802.11b/g or g only
                   //  1:802.11b

    U8 BSSType;    // 0: Ad-Hoc,    1:Infrastructure

    union{
        U8 Byte;

        struct{
            U8 wep      :1;

            U8 wpa      :1;

            U8 wpa2     :1;

            U8 reserved:5;

        }Bit;

        }Security;

    }WifiDev;
```

Parameter	Description	Value
U8 SSID[32]	Service Set Identifier	
U8 BSSID[6]	Basic Service Set ID (MAC ID of WI-FI device)	

char Rssi	Received Signal Strength Indication (dBm)	based on -100dBm e.g. value 40 = -60 dBm
U8 Channel		1~11
U8 BandType		10: 802.11b/g/n or n only, 2: 802.11b/g or g only, 1:802.11b
U8 BSSType		0: Ad-Hoc, 1: Infrastructure
Security		wep bit=1, WEP encryption is enabled in the device wep bit=0, WEP encryption is disabled in the device wpa bit=1, WPA encryption is enabled in the device wpa bit=0, WPA encryption is disabled in the device wpa2 bit=1, WPA2 encryption is enabled in the device wpa2 bit=0, WPA2 encryption is disabled in the device

4.1.6 WI-FI PROFILE STRUCTURE

This structure is provided for the mobile computers to access Wi-Fi profiles. There are total 4 profiles to save Wi-Fi connection settings. Use GetNetParameter() and SetNetParameter() to access these profiles. Refer to [Appendix I-Net Parameters by Index](#)

```
typedef struct{
    U8 SSID[32];

    U8 BSSType;

    U8 Security;

    union{
        struct WEP{
            S8 WepLen;

            S8 DefaultKey;

            S8 WepKey[4][14];

        }WEP;

        struct EAP{
            S8 EapID[33];

            S8 EapPassword[33];

        }EAP;

        S8 WPA passphrase[64];

    }Keys;

}WIFIPROFILE; //size=100 Bytes
```

Parameter	Description	Value
U8 SSID[32]	Service Set Identifier	
U8 BSSType	Basic Service Set	0: Ad-hoc 1: Infrastructure

U8 Security	Authentication and Encryption Type	0: None 1: Open System Authentication+WEP 2: Shared Key Authentication+WEP 3: WPA-Pre-shared Key 4: WPA2-Pre-shared Key 5: EAP
S8 WepLen	Length of WEP Key	0: 64 bits 1: 128 bits
S8 DefaultKey	Default WEP Key	
S8 WepKey[4][14]	WEP Key 0~3	
S8 EapID	ID used to associate to Cisco APs	
S8 EapPassword[33]	Password used to associate to Cisco APs	
S8 WPA passphrase[64]	WPA-PSK, WPA2-PSK. Passphrase to access the network: 8~63 characters	

Example:

```

U8 buf[100];
WIFIPROFILE *ptr;
S8 temp[12]="1234567890";

//To store current WIFI connection setting to Profile1
SetNetParameter((void*)0, P_PROFILE_1);

//Get Profile1 to edit
GetNetParameter(buf, P_PROFILE_1);

ptr=( WIFIPROFILE*)buf;
strcpy(ptr-> Keys.WPA passphrase, temp);

//Save this setting to Profile2
SetNetParameter(buf, P_PROFILE_2);

//Use Profile2 to create a WIFI connection
SetNetParameter((void*)0, P_APPLY_PROFILE_2);

NetInit (0L);          // Initial Net

while (1)
{
    if (CheckNetStatus (NET_IPReady))
        break;

    if (getchar () == KEY_ESC)                // press ESC key
        return;
}

```

4.2 FUNCTIONS

4.2.1 SCANNING FOR WI-FI HOTSPOTS

WIFIScan

Purpose	To detect any Wi-Fi hotspot within range				
Syntax	S32 WIFIScan(WifiDev *APList, S32 Count);				
Parameters	<table><tr><td>WifiDev *APList</td></tr><tr><td>Pointer to WifiDev where the scan results are stored.</td></tr><tr><td>S32 Count</td></tr><tr><td>Maximum number of scan results. The maximum value is 10.</td></tr></table>	WifiDev *APList	Pointer to WifiDev where the scan results are stored.	S32 Count	Maximum number of scan results. The maximum value is 10.
WifiDev *APList					
Pointer to WifiDev where the scan results are stored.					
S32 Count					
Maximum number of scan results. The maximum value is 10.					
Example	<pre>static WifiDev WifiDevList[8]; static int DevNum=0; DevNum=WIFIScan(WifiDevList, 8);</pre>				
Return Value	The amount of the Wi-Fi hotspots detected				
Remarks	<div>▶ The function is executable on-line without breaking the current connection.</div>				
See Also					

BLUETOOTH

Below are available libraries that support DUN-GPRS mode. Refer to [Appendix III — Examples](#).

Hardware Configuration	
8600 Series	8630 – Bluetooth + 802.11b/g/n
	8660 – Bluetooth

Bluetooth Specification	
<i>Frequency Range:</i>	2.4 GHz
<i>Profiles:</i>	SPP, DUN, HID
<i>Spread Spectrum:</i>	FHSS
<i>Modulation:</i>	GFSK
<i>Standard:</i>	Bluetooth version 4.0 Dual Mode (2.1+EDR/BLE)

Note: All specifications are subject to change without prior notice.

IN THIS CHAPTER

5.1 Bluetooth Profiles Supported	82
5.2 Structure	83
5.3 Functions	87

5.1 BLUETOOTH PROFILES SUPPORTED

Serial Port Profile (SPP)
For ad-hoc networking, without going through any access point.

Dial-Up Networking Profile (DUN)
For a mobile computer to make use of a Bluetooth modem or mobile phone as a wireless modem. Also, it can be used to activate the GPRS functionality on a mobile phone.

Human Interface Device Profile (HID)
For a mobile computer to work as an input device, such as a keyboard for a host computer.

CipherLab ACL Packet Data
For a mobile computer to connect to a 36xx device.

5.2 STRUCTURE

5.2.1 BTCONFIG STRUCTURE

Use **GetNetParameter()** and **SetNetParameter()** to change the settings by index. Refer to [Appendix I — Net Parameters by Index](#).

```
typedef struct {
    S8 BTRemoteName[20];
    U8 BTPINCode[16];
    U8 BTLINKKey[16];
    BTSearchInfo Dev[8];      //8*51=408
    BT_FLAG Flag;             //flag setting
    U8 BTGPRSAPname[20];     //the GPRS AP name for BT-GPRS connection
    U8 ACL36xx[16];
    U8 ReservedByte[204];
} BTCONFIG;
```

Parameter	Default	Description	Index
S8 BTRemoteName[20]	Null	ID used for Remote Device association	25
U8 BTPINCode[16]	Null	PIN Code for pairing (usually in Slave mode)	27
U8 BTLINKKey[16]	Null	Link Key generated by pairing	---
BTSearchInfo Dev[8]	Null	See <i>BTSearchInfo</i> Structure	40-47
BT_FLAG Flag	---	See <i>BT_FLAG</i> Structure	26, 28, 29
U8 BTGPRSAPname[20]	Null	Name of Access Point for Bluetooth DUN-GPRS connection	32
U8 ACL36xx[16]	Null	Used by CipherLab ACL packet	---
U8 ReservedByte[204]	Null	Reserved	---

5.2.2 BT_FLAG STRUCTURE

```
typedef struct {  
    unsigned int Reservedflag: 13;  
    unsigned int BTBroadcastON: 1;  
    unsigned int BTSecurity: 1;  
    unsigned int BTPWRSaveON: 1;  
} BT_FLAG;
```

Parameter	Bit	Default	Description	Index
U16 BTPWRSaveON	0	1	Bluetooth Power-saving 0: disable 1: enable	29
U16 BTSecurity	1	0	Bluetooth Security 0: disable 1: enable	26
U16 BTBroadcastON	2	1	Bluetooth broadcasting 0: disable 1: enable	28
U16 Reservedflag	3-15	0	Reserved	---

Note: When Bluetooth security is enabled without providing a pre-set PIN code, dynamic input of PIN code is supported.

5.2.3 BTSEARCH STRUCTURE

```
typedef struct {
    U8 Machine;
    U8 ADDR[6];
    U8 Name[32];
    U8 PINCode[16];
    U8 LinkKey[16];
} BTSearchInfo;
```

size = 71 bytes

Parameter	Default	Description	Index
U8 Machine	0	Host profile indication 0: empty 1: AP 3: SPP 4: DUN 6: Reserved 7: FTP (If bit 7=1, it means the device is currently connected.)	40-47
U8 ADDR[6]	Null	Host MAC ID	
U8 Name[32]	Null	HostName	
U8 PINCode[16]	Null	PIN code for pairing (Master mode)	
U8 LinkKey[16]	Null	Link Key generated by pairing	

5.2.4 BTSTATUS STRUCTURE

User program must explicitly call **CheckNetStatus()** to get the latest status. Refer to [Appendix III — Net Status by Index](#).

```
typedef struct {  
    S16 State;  
    S16 Signal;  
    S16 Reserved[10];  
} BTSTATUS;
```

Parameter	Description	Value		Index
S16 State	Connection State	0	BT_DISCONNECTED	7
		1	BT_CONNECTED	
S16 Signal	RSSI Signal Level	-10 ~ -6	Weak	8
		-6 ~ 5	Moderate	
		over 5	Strong	
S16 Reserved[10]	Reserved	Null	---	---

5.3 FUNCTIONS

Note: For the stability and compatibility concern, it is recommended to use **GetNetParameter()**, **SetNetParameter()**, and **CheckNetStatus()**.

5.3.1 FREQUENT DEVICE LIST

Through the pairing procedure, the mobile computer is allowed to keep record of the latest connected device(s) for different Bluetooth services, regardless of authentication enabled or not. Such record is referred to as "Frequent Device List".

Service Type		In Frequent Device List
Serial Port	SPP	Only 1 device is listed for quick connection.
Dial-up Networking	DUN	Only 1 device is listed for quick connection.
Human Interface Device	HID	Only 1 device is listed for quick connection.

Refer to [5.2.3 BTSEARCH Structure](#) for details.

Get Frequent Device List

The length of Frequent Device List by calling **GetNetParameter()** is 51 characters:

```
BTSearchInfo DeviceA;
GetNetParameter(&DeviceA, 40);
```

Set Frequent Device List

To enable quick connection to a specific device without going through the inquiry and pairing procedure, a user-definable Frequent Device List can be set up by calling **SetNetParameter()**.

- ▶ If there is an existing Frequent Device List generated from the inquiry and pairing procedure, it then may be partially or overall updated by this, and vice versa.
- ▶ There are five fields: Service Type, MAC ID, Device Name, PIN Code, and Link Key. If authentication is disabled, you only need to specify the first three fields. Otherwise, the PIN code field needs to be specified for generating Link Key.

5.3.2 INQUIRY

To complete the pairing procedure, it consists of two steps: (1) to discover the Bluetooth devices within range, and (2) to page one of them that provides a particular service. These are handled by **BTInquiryDevice()** and **BTPairingTest()** respectively.

- ▶ Once the pairing procedure is completed and the list is generated, next time the mobile computer will automatically connect to the listed device(s) without going through the pairing procedure.

BTInquiryDevice	
Purpose	To discover any nearby Bluetooth devices.
Syntax	S16 BTInquiryDevice (BTSearchInfo *Info, S16 max);
Parameters	BTSearchInfo *Info
	Pointer to BTSearchInfo structure where the information of paired devices is stored.
	S16 max
	Maximum number of Bluetooth devices that can be inquired.
Example	<pre> BTSearchInfo Info[4]; S16 Rst; Rst = BTInquiryDevice(Info, 4); if (Rst) { printf("Find %d devices in range", Rst); } </pre>
Return Value	It returns information on the devices discovered. Refer to 5.2.3 BTSEARCH Structure structure.
Remarks	<p>This routine gets information on Bluetooth devices nearby.</p> <ul style="list-style-type: none"> ▶ It will take about 20 seconds to find devices.
See Also	BTPairingTest

5.3.3 PAIRING

According to the search results for nearby Bluetooth devices, the application can then try to pair with any of the remote devices by calling **BTPairingTest()**.

BTPairingTest

Purpose To pair with one Bluetooth device.

Syntax **S16 BTPairingTest (BTSearchInfo *Info, S16 TargetMachine);**

Parameters

BTSearchInfo *Info		
Pointer to BTSearchInfo structure where the information of paired devices is stored.		
S16 Targetmachine		
3	BTSerialPort	Bluetooth Serial Port service (= SPP)
4	BTDialUpNetworking	Bluetooth Dial-up Networking service (= DUN)

Example

```
BTSearchInfo Info[4];

S16 Rst;

.....

Rst = BTInquiryDevice(Info, 4);

if (Rst) {

    printf("Find %d devices in range", Rst);

    Rst = BTPairingTest(&Info[0], BTSerialPort);

    if (Rst) printf("Pair OK");

    else printf("Pair Fail");

    .....

}
```

Return Value If successful, it returns 1.

On error, it returns 0.

Remarks This routine tries to pair with one Bluetooth device with matching type of service (SPP, DUN or FTP) specified by *TargetMachine*.

- Once pairing successfully, the MAC ID, PIN Code, and Link Key of this remote device will be updated to the Frequent Device List.

See Also BTInquiryDevice

5.3.4 USEFUL FUNCTION CALL

We also provide some simple function calls for pairing with a Bluetooth device easily.

BTPairingTestMenu

Purpose	To create a menu and try to pair with one Bluetooth device.
Syntax	void BTPairingTestMenu (void);
Example	See sample code.
Return Value	None
Remarks	Once pairing successfully, the MAC ID of this remote device will be updated to the Frequent Device List.
See Also	BTPairingTest, FreqDevListMenu

FreqDevListMenu

Purpose	To create a menu (Frequent Device List) listing all the devices that the mobile computer frequently connects to.
Syntax	void FreqDevListMenu (void);
Example	See sample code.
Return Value	None
See Also	BTPairingTestMenu

Sample Code

```
=====
#include <8600lib.h>
#include <ucos.h>

static const MENU_ENTRY PAIRING_ENTRY;
static const MENU_ENTRY DEVICELIST_ENTRY;

MENU SPP_MENU =
{2, 1, 0, "Bluetooth", {(void*)&PAIRING_ENTRY, (void*)&DEVICELIST_ENTRY}};
static const MENU_ENTRY PAIRING_ENTRY = {0, 1, "1 Pairing", BTPairingTestMenu, 0};
static const MENU_ENTRY DEVICELIST_ENTRY = {0, 2, "2 Dev. List", FreqDevListMenu, 0};
main()
{
while (1) prc_menu((void*)&SPP_MENU);
}
```

5.3.5 ACL FUNCTIONS

Get36xxParameter

Purpose To get a parameter of 3610.

Syntax **void Get36xxParameter (void *nc, U32 index);**

Parameters

void *nc

A parameter for 3610.

U32 index

Index number of the parameter (see the table below).

Example

```
U8 SN[9];
```

```
Get36xxParameter(SN, P_36XXSN);
```

Return Value

None

See Also

Set36xxParameter

Index		Data Type	Default	Description
0	P_SET_TO_36XX			Update parameter to 36xx. It's valid only when the Bluetooth connection between terminal and 36xx has been established.
1	P_ACL_TYPE	U8	95	The type of Bluetooth for ACL 95:ACL_CDCVCOM 96:ACL_VCOM 97:ACL_PCAT_US 98:ACL_PCAT_French 99:ACL_PCAT_German 100:ACL_PCAT_Italy 101:ACL_PCAT_Swedish 102:ACL_PCAT_Norwegian 103:ACL_PCAT_UK 104:ACL_PCAT_Belgium 105:ACL_PCAT_Spanish 106:ACL_PCAT_Portuguese 107:ACL_PS55A01_2_Japanese 108:ACL_USER_Defined_KBD 109:ACL_PCAT_Turkish 110:ACL_PCAT_Hungarian 111:ACL_PCAT_Swiss 112:ACL_PCAT_Danish
2	P_INTER_CHAR_DELAY	U8	0	Inter-Character Delay (0~254 ms)

3	P_36XXSN	U8[9]	S/N	To set the serial number of 3610 for connection through the Bluetooth
4	P_DIGITS_TRANS	U8	0	Digits Transmission 0: AlphaNum Key 1: Numeric Key
5	P_CAPSLOCK_TYPE	U8	0	Capital Lock Type 0: Normal 2: Capital Lock 3: Shift Lock
6	P_DIGIS_LAYOUT	U8	0	Digital Layout. 0: Normal 2: Lower Row 3: Upper Row
7	P_ALPHABET_TRANS	U8	0	Alphabets Transmission 0: Case-sensitive 1: Ignore Case
8	C_CAPSLOCK_MODE	U8	0	Capital Lock 0: Capital Lock OFF 1: Capital Lock ON 2: Auto Detect
9	P_ALT_COMPOSE	U8	0	Alt Compose 0: disable Alt Sending 1: enable Alt Seding
--	--	--	--	--
11	P_KBD_LAYOUT	U8	0	Alphabets Layout 0: Normal 1: AZERTY 2: QWERTZ
12	P_HID_CHAR_TRANS	U8	0	HID Character Transmit Mode 0: Batch Processing 1: By Character

Set36xxParameter

Purpose To set a parameter of 3610 through Bluetooth.

Syntax **S8 Set36xxParameter (void *nc, U32 index);**

Parameters

void *nc

A parameter for 3610.

U32 index

Index number of the parameter.

Example

```
U8 SN[9], P;
memcpy(SN, "BS6065535", 9);
Set36xxParameter(SN, P_36XXSN);
P=ACL_VCOM;
Set36xxParameter(&P, P_BTACL_Type);
```

Return Value

Result	Return Value
Setting successful	1
Setting failed	0
Can't be set (not connected or 3610 not ready)	-1 (*1)
Wrong parameter	-2

*1: Not connected or 3610 not ready

See Also

Get36xxParameter

USB CONNECTION

Applications are to read and/or write data via a virtual COM port, namely, *COM5*. The communication types, *COMM_USBHID*, *COMM_USBVCOM*, *COMM_USBVCOM_CDC* and *COMM_USBDISK*, should be assigned by calling **SetCommType()** before use.

Refer to [Appendix III — Examples](#).

IN THIS CHAPTER

6.1 Overview	98
6.2 Structure	99

6.1 OVERVIEW

6.1.1 USB HID

The mobile computer can be set to work as an input device, such as a keyboard for a host computer.

6.1.2 USB VIRTUAL COM

USB Virtual COM

When USB Virtual COM is in use, the mobile computer is set to use one Virtual COM port for all (USB_VCOM_FIXED) whenever connecting more than one mobile computer to PC via USB. This setting requires you to connect one mobile computer at a time, and will facilitate configuring a great amount of mobile computers via the same Virtual COM port (for administrators' or factory use). If necessary, you can have it set to use variable Virtual COM port (USB_VCOM_BY_SN), which will vary by the serial number of each different mobile computer.

USB Virtual COM_CDC

When USB Virtual COM_CDC is in use, the mobile computer is set to use one Virtual COM_CDC port for all (USB_VCOM_FIXED) whenever connecting more than one mobile computer to PC via USB. This setting requires you to connect one mobile computer at a time, and will facilitate configuring a great amount of mobile computers via the same Virtual COM_CDC port (for administrators' or factory use). If necessary, you can have it set to use variable Virtual COM_CDC port (USB_VCOM_BY_SN), which will vary by the serial number of each different mobile computer.

6.1.3 USB MASS STORAGE DEVICE

When the mobile computer is equipped with SD card and connected to your computer via the USB cable, it can be treated as a removable disk as long as it is configured properly through programming or System Menu.

6.2 STRUCTURE

6.2.1 USBCONFIG STRUCTURE

Use **GetNetParameter()** and **SetNetParameter()** to change the settings by index.
Refer to [Appendix I — Net Parameters by Index](#).

```
struct USBCONFIG {
    USB_FLAG1 Flag1;
    U8 ReservedByte[126];
};
```

Parameter	Default	Description	Index
USB_FLAG1 Flag1	---	See <i>USB_FLAG1</i> Structure	80
U8 ReservedByte[126]	Null	Reserved	---

6.2.2 USB_FLAG STRUCTURE

```
typedef struct {
    U16 CommBySerial: 1;
    U16 Reservedflag: 15;
} USB_FLAG1;
```

Parameter	Bit	Default	Description	Index
U16 CommBySerial	0	0	USB Virtual COM 0: USB_VCOM_FIXED 1: USB_VCOM_BY_SN (= Port No. change with serial number)	80
U16 Reservedflag	1-15	0	Reserved	---

Chapter 7

GPS FUNCTIONALITY

8600 supports GPS functionality as long as the GPS module is present. The information on GPS speed, latitude, longitude and altitude is not confirmed until the return value of GPS status becomes 1.

IN THIS CHAPTER

7.1 Structure	102
7.2 Functions	103

7.1 STRUCTURE

7.1.1 GPSINFO STRUCTURE

Use **GetGpsInfo()** to access the GPS information.

```
typedef struct {
    U8 Status;
    U32 Speed;
    U8 Latitude[11];
    U8 Longitude[12];
    U8 SNR;
    U8 SatelliteNum;
    S32 Altitude;
} GPSINFO;
```

Member	Description
U8 Status	0: invalid data (= not positioned yet) 1: valid data (= positioned)
U32 Speed	Your speed when heading toward a target (relative speed, km/h)
U8 Latitude[11]	Your location on earth by latitude coordinates (N for North, S for South) <ul style="list-style-type: none"> ▶ ddmm.mmmmmN or ddmm.mmmmmS ▶ For example, 1211.1111N means 12° 11' 6.67" North.
U8 Longitude[12]	Your location on earth by longitude coordinates (E for East, W for West) <ul style="list-style-type: none"> ▶ dddmm.mmmmmE or dddmm.mmmmmW ▶ For example, 2326.2141E means 23° 26' 12.85" East.
U8 SNR	Signal to Noise ratio, average (dB)
U8 SatelliteNum	Number of satellites found
S32 Altitude	Your location on earth by altitude (meters)

7.2 FUNCTIONS

GetGpsInfo

Purpose To get GPS information.

Syntax **U8 GetGpsInfo (void *buf, U8 index) ;**

Parameters

void *buf		
Pointer to a buffer where information is stored.		
U8 index		
1	GPS_STATUS	The information on GPS speed, latitude, longitude and altitude is not confirmed until the return value of GPS_STATUS becomes 1.
2	GPS_SPEED	
3	GPS_LATITUDE	
4	GPS_LONGITUDE	
5	GPS_SNR	
6	GPS_SATELLITE_NUM	
7	GPS_ALTITUDE	

Example

```
unsigned char buf[13];
GetGpsInfo(buf, GPS_LATITUDE);
```

Return Value If successful, it returns 1.
Otherwise, it returns 0 to indicate the GPS functionality is not enabled yet.

StartGps

Purpose	To enable GPS functionality.
Syntax	void StartGps (void);
Example	<code>StartGps();</code>
Return Value	None

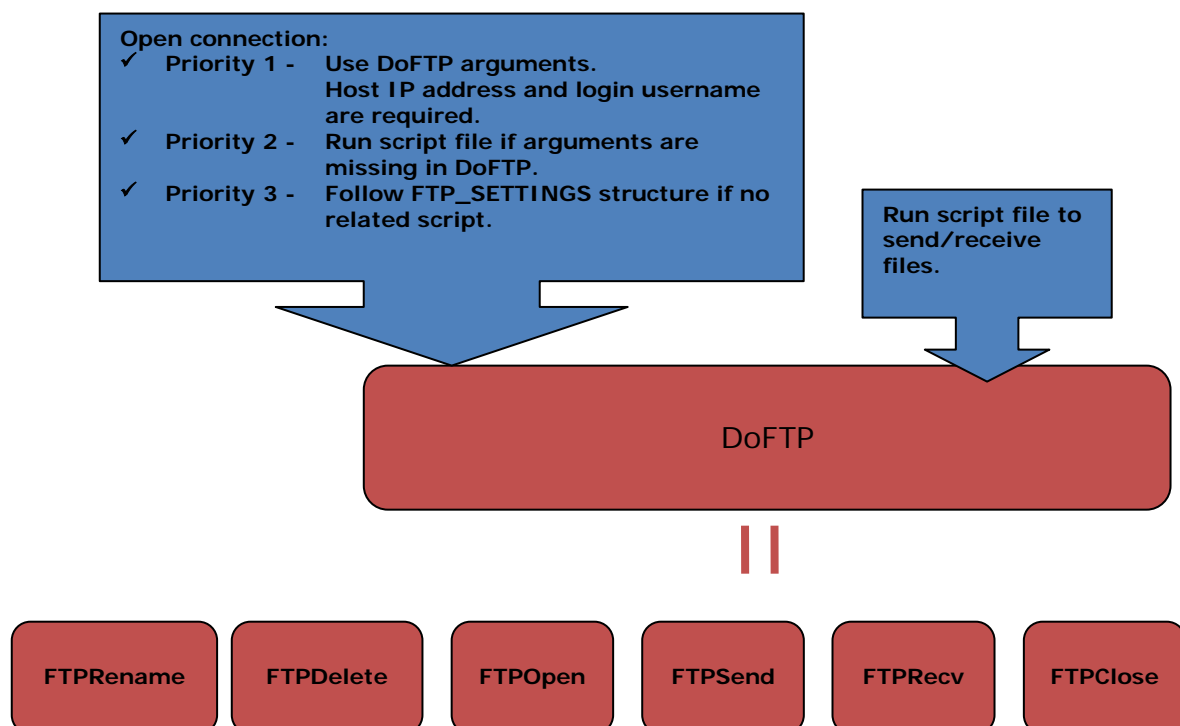

StopGps

Purpose	To disable GPS functionality.
Syntax	void StopGps (void);
Example	<code>StopGps();</code>
Return Value	None

FTP FUNCTIONALITY

File Transfer Protocol (FTP), which runs over Transmission Control Protocol (TCP), is used to transfer files over any network that supports TCP/IP regardless of operating systems. The FTP functions provided here are for the mobile computer to log in to any FTP server and log out over network. During a valid session, the mobile computer can issue commands to the server to perform a specific task, such as to create, change, remove directories on the server, delete, upload, or download files.

In this chapter, we explain the basics of establishing an FTP connection via the DoFTP function and scripts. For use of separate FTP functions, please refer to [8.4 Advanced FTP Functions](#). If file transfer is desired with the default working directory on the FTP server, use the DoFTP function to automatically do the same task performed by calling **FTPOpen()**, **FTPSend()**, **FTPRecv()**, **FTPDelete()**, **FTPRename()** and finally **FTPClose()**. That is, it will start a process to open a connection, log on to the host, upload and/or download files, and then close the connection.

Note: Only one connection is allowed at a time.

IN THIS CHAPTER

8.1 Using DoFTP Function	107
8.2 Editing Script File	111
8.3 Structure	120
8.4 Advanced FTP Functions	121
8.5 File Handling	131
8.6 SD Card Access	133

8.1 USING DOFTP FUNCTION

8.1.1 FUNCTION

DoFTP

Purpose To automatically do the same task performed by calling FTPOpen(), FTPSend(), FTPRecv(), FTPDelete(), FTPRename(), and finally FTPClose().

Syntax **S32 DoFTP (S8 IFMode,**
S8 *HostIP,
S8 *Username,
S8 *Password,
S8 *Port);

Parameters

S8 IFMode	
via802dot11	802.11b/g/n
viaEthernetCradle	Ethernet Cradle
S8 *HostIP	
Pointer to a buffer where the IP address of FTP server is stored.	
S8 *Username	
Pointer to a buffer where the username string is stored (Max. 64 characters).	
S8 *Password	
Pointer to a buffer where the password string is stored (Max. 64 characters).	
S8 *Port	
Pointer to a buffer where the remote port number is stored.	
► By default, TCP port 21 is used on the server for the control connection.	

Example DoFTP (via802dot11, (S8 *)"192.168.17.6", (S8 *)"test4669", (S8 *)"1234", (S8 *)"21");

Return Value If successful, it returns 0.

On error, it returns a non-zero value to indicate a specific error condition.

Return Value	
-1	FTPOpen failed, or another DoFTP is running
-2	Failed to update or receive FTP.dat, or failed to get parameters from the script file
-3	Failed to resolve hostname to binary IP address
-4	Failed to connect to host
-5	Incorrect username
-6	Incorrect password
-7	Failed to switch to a different server specified in the new script file.

-8	Failed to update program(s)
-10	Failed to set binary transfer mode
-20	Host IP is empty
-21	Username is empty
-1001 ~ -1999	Failed to transmit or receive files <ul style="list-style-type: none"> ▶ The last 3 digits refer to a total number of files, e.g. "-1003" means it failed to transmit or receive 3 files

Remarks

When successfully connected to the server and no script file is found on the mobile computer, it will check for any script file on the server. When available, it will download the file for immediate use.

Refer to Appendix IV — FTP Response & Error Code.

- ▶ FTP messages are stored in the global array *szFTPReplyCode[256]*.
- ▶ For *DoFTP()*, the messages are stored in the global array *szFTPResponseTbl[1024]*. If an error occurs, the error code will be appended to the message, indicating the error condition encountered.

8.1.2 LOG

For the various activities performed by **DoFTP()**, it maintains a history of all the results and saves to the array `szFTPResponseTbl[DOFTP_RECORD_SIZE(1024)]`. When the buffer is entirely full, the array will be cleared before saving more recent entries. When there is another attempt of **DoFTP()**, the array will be cleared as well.

Log Format

Action: Para1: Para2: Para3: Result

Event	Action	Parameter	Example
Establish a connection...	E	Para1: IP Para2: Username Para3: Password	Success: E:192.168.6.24:UserTest:1234:O Failure: E:192.168.6.24:UserTest:1234:X
Login...	L	Para1: IP Para2: Username Para3: Password	Success: L:192.168.6.24:UserTest:1234:O Failure: L:192.168.6.24:UserTest:1234:X
Switch to another server...	W	Para1: IP Para2: Username Para3: Password	Success: W:192.168.6.1:UserTest:1234:O Failure: W:192.168.6.24:UserTest:1234:X E:192.168.6.24:UserTest:1234:X OR W:192.168.6.24:UserTest:1234:X L:192.168.6.24:UserTest:1234:X
Get IP from script file...	P	Para1: IP Para2: Username Para3: Password	Success: P:192.168.6.1:UserTest:1234:O Failure: P:192.168.6.1:UserTest:1234:X
Upload files to server...	S	Para1: Local file name Para2: Remote file name	Success: S:test:test20000111061852.txt::O Failure: S:test:testCipherlab.txt::X
Download files from server...	R	Para1: Local file name Para2: Remote file name	Success: R:test:FTPTTest/test.txt::O Failure: R:test:FTPTTest/test.txt::X

Network initialization...	I	No parameters	Success: I:::O Failure: I:::X
Update the script file...	U		Success: U:::O Failure: U:::X
Get directory information...	D		Success: D:::O Failure: D:::X
Delete files from the FTP server	d	Para2: Remote file name	Success: d::FTPTest/test.txt::O Failure: d::FTPTest/test.txt::X
Rename the files on the FTP server	r	Para1: New file name Para2: Old file name	Success: r:test:FTPTest/test.txt::O Failure: r:test:FTPTest/test.txt::X

8.2 EDITING SCRIPT FILE

The script must be saved to the file `FTP.dat` in the following format.

- ▶ If connection arguments (ServerIP, TCPport, Username, and Password) are passed to the DoFTP function, it will run the script file with the received arguments to establish an FTP session and then send and/or receive files.
- ▶ If no arguments received, the DoFTP function will run the script file to establish an FTP session and transfer files accordingly.

File Name

```
FTP.dat                                /*
                                     ** The file name "FTP.dat" is reserved for the
                                     ** script file. Do not use it with "rFile=" or
                                     ** "tFile=". Because it is hard-coded, the file
                                     ** name must be uppercase while the file
                                     ** extension must be lowercase.
                                     */
```

Format

```
ServerIP=

TCPport=

Username=

Password=

UpdateScript,<Version control>,<Mandatory>

rFile=<Local file name1>,<Remote file name>,<Version control>,<Mandatory>

rFile=<Local file name2>,<Remote file name>,<Version control>,<Mandatory>

rFile=<Local file name3>,<Remote file name>,<Version control>,<Mandatory>

...

tFile=<Local file nameX>,<Remote file name>,0,<Mandatory>

rFile=<Local file name10>,<Remote file name>,<Version control>,<Mandatory>

...
```

Example

```
ServerIP=192.168.17.6
```

```
TCPport=21
```

```
Username=test4669
```

```
Password=1234
```

```
UpdateScript,1,M
```

Check whether new script file is available.
When there is no script file on the server, stop
running script.

```
rFile=Rcv1.txt,Lookup1.txt,0,
```

```
rFile=Rcv2.txt,Lookup2.txt,1,
```

```
rFile=Rcv3.txt,Lookup3.txt,1,
```

```
...
```

```
tFile=A:/TestFile,Txac,0,
```

```
...
```

```
tFile=Send1,Txac_test,0,
```

```
rFile=Send1,Txac_test,-1,
```

```
/* Upload and delete the file. Remote file name is ignored */
```

```
...
```

```
tFile=,Lookup4.txt,-1,
```

```
/* deletes the Lookup4.txt from the FTP server */
```

```
...
```

```
tFile=Lookup6,Lookup5,-2,
```

```
/* renames the Lookup5 on the FTP server to "Lookup6" */
```

Line	Default	Description
ServerIP=	Null	IP address of FTP server
TCPport=	Null	Remote port number ► By default, TCP port 21 is used on the server for the control connection.
Username=	Null	User name for logging onto FTP server
Password=	Null	Password for logging onto FTP server

UpdateScript, ...	Null	<p>"UpdateScript,(1/0)" is required for checking updates to the script file, with given version control. This line must be run before transmitting or receiving files.</p> <ul style="list-style-type: none"> ▶ If a different server is specified, it will connect to the new server in the next connection. ▶ If you need to switch to a different server immediately, use the SWITCH command.
rFile=	Null	<p>Receive a specific file with given version control</p> <ul style="list-style-type: none"> ▶ Local file name: It's case-sensitive. File extension omitted is allowed. ▶ Remote file name: It must follow the rules of the file system used by FTP server. Wild card is supported. ▶ User program update is allowed when the file name is prefixed with the character "~". Also, version control will be ignored.
tFile=	Null	<p>Transmit a specific file with version control set off</p> <ul style="list-style-type: none"> ▶ local file name: Whether including file extension or not, a local file name must not exceed 8 characters and must be case-sensitive. ▶ remote file name: Such name must follow the remote FTP server's file system's rules. Wild card is supported. ▶ Version control must be set to 0. <p>Delete a specific file from the FTP server</p> <ul style="list-style-type: none"> ▶ The first parameter must be ignored. ▶ remote file name: Such name must follow the FTP server's file system's rule. Wild card is supported. ▶ Version control must be set to -1. <p>Rename a specific file on the FTP server</p> <ul style="list-style-type: none"> ▶ new file name: The file name to replace the old one. ▶ old file name: The file name to be replaced by the new one. ▶ Version control must be set to -2.

Note: Access to SD card is allowed; however, file name is not case-sensitive. Refer to [8.6 SD Card Access](#). Although file name may be case-sensitive on remote host, for use with SD card, it is suggested to avoid using letter case for identifying two files with identical file name, such as "AAA.txt" and "aaa.txt".

8.2.1 REMOTE FILE INFORMATION

Upon completion of executing **DoFTP()** but before closing the connection, it will automatically save remote file information to the file *DIRList* on the mobile computer. Such up-to-date information lists file entries in the default working directory.

File Entry Format

Each entry is saved in the following format: `YYYYMMDDhhmmss<file name>(0x0d)`

It consists of

14 digits for the time when each file is created on the server.

A file name, which is case-sensitive and can be made up of 8 characters at most, with or without file extension included. For example, "TestFile" and "Svr1.txt" are considered acceptable.

You may use **FTPRecv()** to save the remote file information to another file, whose file entry format depends on where it is saved to. For example,

```
FTPRecv((S8 *)"FileList", (S8 *)"", (S8 *)"");

/* Save to SRAM, file name is case-sensitive */

FTPRecv((char *)"A:\\FileList", (S8 *)"", (S8 *)"");

/* access to SD is allowed, file name is NOT case-sensitive */
```

8.2.2 LOCAL FILE INFORMATION

Upon completion of downloading a file via **DoFTP()**, it will automatically add or update the entry to the file *RCVList* on the mobile computer.

File Entry Format

Each entry is saved in the following format:

`YYYYMMDDhhmmss<file name>YYYYMMDDhhmmss(0x0d)`

It consists of

14 digits for the time when each file is created on the server.

A file name, which is case-sensitive and can be made up of 8 characters at most, with or without file extension included. For example, "TestFile" and "Rcv1.txt" are considered acceptable.

14 digits for the time when each file is downloaded to the mobile computer.

Access to SD card is allowed. Refer to [8.6 SD Card Access](#). The entry in the file *RCVList* is in full path. For example,

```
YYYYMMDDhhmmssA:/FTP/Test/8X00.TXTYYYYMMDDhhmmss(0x0d)

YYYYMMDDhhmmssA:/FTP/Test/8X00.TXT00000000000000(0x0d)
```

8.2.3 VERSION CONTROL

Version control only takes effect when the following two conditions are satisfied:

- ▶ The mobile computer has started an FTP session via **DoFTP()** over network.
- ▶ The script line must start with "rFile=" or "UpdateScript".

Version Control	Description
0	Disable version control <ul style="list-style-type: none"> ▶ For the lines starting with "tFile=", version control must be set to 0.
1	Enable version control <ul style="list-style-type: none"> ▶ Checks the local file information against the remote file information. ▶ For the lines starting with "rFile=", if no existing file is found or the file is not recorded in the file <i>RCVList</i> on the mobile computer, the version control is ignored and the specified files are received. ▶ For the lines starting with "UpdateScript", if no existing script file is found on the mobile computer, version control is ignored and the specified files are received.
-1	rFile: Deletes files from the mobile computer <ul style="list-style-type: none"> ▶ For the lines starting with "rFile=" only. Any specified remote file name will be ignored. ▶ The entry saved in the file <i>RCVList</i> will be modified: from YYYYMMDDhhmmss<file name>YYYYMMDDhhmmss(0x0d) to YYYYMMDDhhmmss<file name>00000000000000(0x0d) tFile: Deletes files from the FTP server <ul style="list-style-type: none"> ▶ any specified local file name will be ignored.
-2	Renames the files on the FTP server <ul style="list-style-type: none"> ▶ For the lines starting with "tFile=" only.

8.2.4 MANDATORY FLAG

The flag is used to set a breakpoint. While running script, it may stop at a line with such flag if it fails to transmit or receive the file. For example,

```
UpdateScript,1,M
tFile=Test.txt,SvrTest.txt,0,M
```

8.2.5 UPDATE SCRIPT FILE

"UpdateScript,(1/0)" is required for checking any update to the script file. This line must be run before transmitting or receiving files.

Format

The line must be "UpdateScript,(1/0),<Mandatory>".

When new script file is available, it will first update the script file, and then run the lines in the new script file to transmit or receive files, as shown below.

Note: If a different server is specified in the new script, it will connect to the new server in the next connection. If you need to switch to a different server immediately, use the SWITCH command.

8.2.6 UPDATE USER PROGRAM

Program update is allowed via **DoFTP()** when a user program (.bin) is properly specified in the script file. Upon completion of executing **DoFTP()**, it will automatically update the program.

Format

The line must be as shown below:

```
rFile=~<Local file name>,<Remote file name>,<version control>,<Mandatory>
```

For example,

```
rFile=~CipherAP,NewAP,0,
/* Save to SRAM, local file name is case-sensitive */
rFile=~A:/FTP/user.bin,NewAP,0,
/* Local file name is NOT case-sensitive */
```

On the right of the equal sign, it consists of

The character “~”.

A file name, which is case-sensitive and can be made up of 8 characters at most, with file extension included. For example, “CipherAP” and “User.bin” are considered acceptable.

Version control; however, it will be ignored.

8.2.7 SWITCH TO A DIFFERENT SERVER

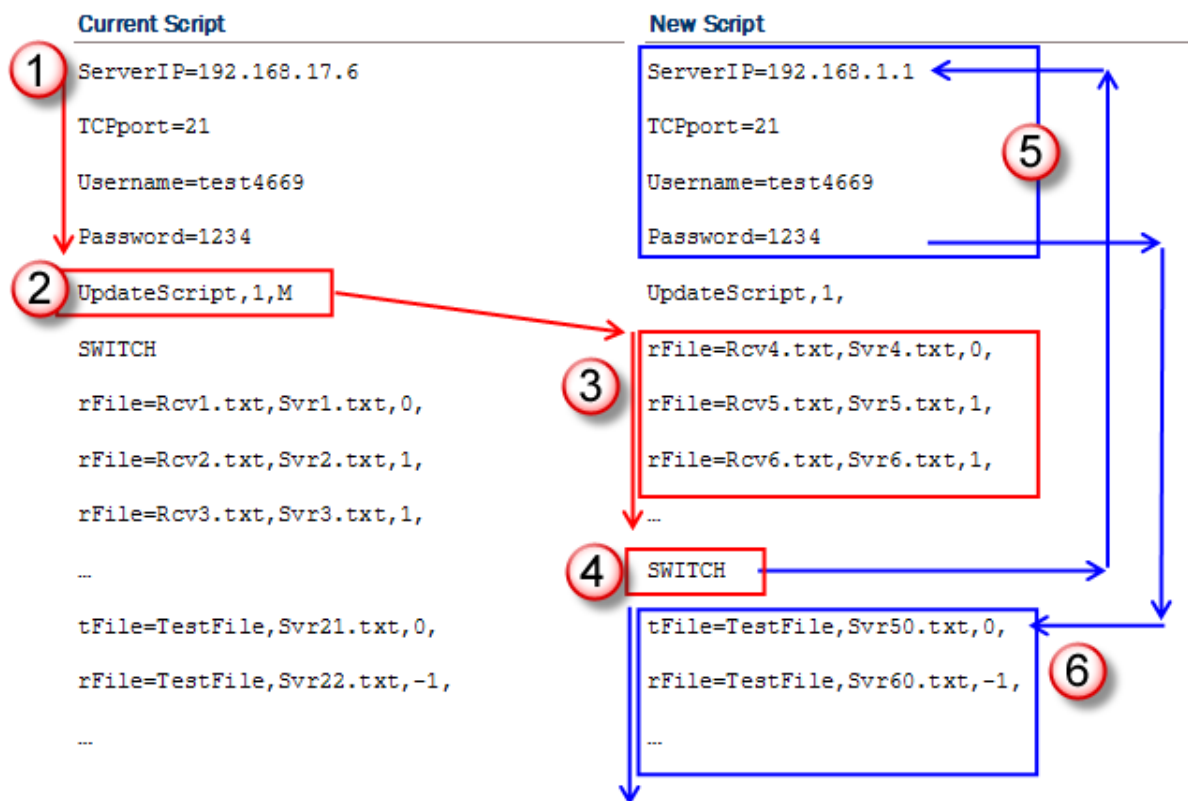

The “SWITCH” command is supported for immediate switching to a different server specified in the new script file. This line must be run after the connection settings and “UpdateScript”.

Format

The line must be “SWITCH”, all in uppercase.

When new script file is available, it will first update the script file, and then compare whether the connection settings between the original script and the update are the same.

- ▶ When server IP or username is found different, it will disconnect the current connection immediately, and use the updated connection settings to establish a new connection.
- ▶ In the new connection, the “UpdateScript” line will not be executed until it connects to the new server in the next connection.
- ▶ If it fails to execute the “SWITCH” command, it will stop executing the rest of lines after “SWITCH”.
- ▶ If there is more than one “SWITCH” line, only the first one will be executed.

8.2.8 WILDCARDS FOR REMOTE FILE NAME

Wildcard characters are supported for distinguishing the files transmitted from the mobile computer to the FTP server.

- ▶ Start with a "%" character, followed by a capital letter: %T, %N or %I
- ▶ Only valid for remote file names
- ▶ Can be inserted to any place in the file name
- ▶ Can be applied multiple times and in combinations, as long as the actual file name does not exceed 256 characters. If the file name becomes too long, it will be truncated automatically. If it comes with a file extension, this will result in leaving it out.

Three wildcards are supported for remote file names:

%T

Use "%T" to insert device system time (14 characters) to file name of the files transmitted to the server.

%N

Use "%N" to insert device serial number (9 characters by factory default) to file name of the files transmitted to the server.

%I

Use “%I” to insert user-specified string (max. 16 characters) to file name of the files transmitted to the server. Refer to [8.4.9 Wildcards for Remote File Name \(User-Specified String\)](#)

Example

```
tFile=test,test%T.txt,0,M      /* Remote file name, ex. test20000111061852.txt */  
tFile=test,test%I.txt,0,M      /* Remote file name, ex. testCipherlab.txt */  
tFile=test,test%N.txt,0,M      /* Remote file name, ex. testDB9001999.txt */  
tFile=test,test%N+%I+%T.txt,0, /* Ex. testDB9001999+Cipherlab+20000111061905.txt */
```

8.3 STRUCTURE

8.3.1 FTP_SETTINGS STRUCTURE

You may store the default connection settings to this structure.

Note: These settings are efficacious only when no arguments in **DoFTP()** and no script for connection settings.

extern FTP_SETTINGS	FtpConfig
---------------------	-----------

```
typedef struct {  
    S8 ServerIP[254];  
    S8 TCPport[8];  
    S8 Username[65];  
    S8 Password[65];  
} FTP_SETTINGS;
```

Parameter	Default	Description
S8 ServerIP[254]	Null	IP address of FTP server, or a null-terminated hostname ▶ For hostname, the string
S8 TCPport[8]	Null	Remote port number ▶ By default, TCP port 21 is used on the server for the control connection.
S8 Username[65]	Null	User name for logging on to FTP server
S8 Password[65]	Null	Password for logging on to FTP server

8.4 ADVANCED FTP FUNCTIONS

Below lists the advanced FTP functions supported in separate external libraries. You may use these functions to start an FTP session, instead of using the **DoFTP()** function.

- ▶ Call **FTPOpen()** to open a connection and log on to the host.
- ▶ Call **FTPClose()** to close the connection.
- ▶ Call **FTPDir()** to save remote file information in the current working directory to the file DIRList on the mobile computer.
- ▶ Call **FTPCwd()** to change the current working directory.
- ▶ Call **FTPSend()** or **FTPAppend()** to upload files.
- ▶ Call **FTPRecv()** to download files.
- ▶ Call **FTPDelete()** to delete files from the FTP server.
- ▶ Call **FTPRename()** to rename the files on the FTP server.

8.4.1 CONNECT: FTPOpen

FTPOpen

Purpose To open a connection and log on to the host network over wireless network (802.11b/g/n).

Syntax **S32 FTPOpen (S8 *HostIP,**
S8 *Username,
S8 *Password,
U32 nPort);

Parameters

S8 *HostIP
Pointer to a buffer where the IP address or hostname of FTP server is stored. (Max. 253 characters for hostname) ▶ Use "0,0,0,0" for Bluetooth FTP connection.
S8 *Username
Pointer to a buffer where the username string is stored. (Max. 64 characters)
S8 *Password
Pointer to a buffer where the password string is stored. (Max. 64 characters)
U32 nPort
Pointer to a buffer where the remote port number is stored. ▶ By default, TCP port 21 is used on the server for the control connection. ▶ Use port 0 for Bluetooth FTP connection.

Example

```
NetInit();           //select network via 801.11b/g/n
while(1){           //Check if initialization is done
    if (CheckNetStatus(NET_IPReady)) break;
    OSTimeDly(4);
}

FTPOpen((S8 *)"192.168.17.6", (S8 *)"test4669", (S8 *)"1234", 21);
//log on to the ftp server
```

Return Value

If successful, it returns 0.

On error, it returns a non-zero value to indicate a specific error condition.

<i>Return Value</i>	
-3	Failed to resolve hostname to binary IP address
-4	Failed to connect to host
-5	Incorrect username
-6	Incorrect password
-10	Failed to change ASCII mode to binary mode
-20	Host IP is empty
-21	Username is empty

Remarks	Refer to Appendix V — FTP Response & Error Code. ▶ FTP messages are are stored in the global array <i>szFTPReplyCode[256]</i> .
See Also	FTPClose

8.4.2 DISCONNECT: FTPCLOSE

FTPClose	
Purpose	To close the connection.
Syntax	void FTPClose (void);
Example	<code>FTPClose();</code>
Return Value	None
Remarks	Refer to Appendix V — FTP Response & Error Code. ▶ FTP messages are are stored in the global array <i>szFTPReplyCode[256]</i> .
See Also	FTPOpen

8.4.3 GET DIRECTORY: FTPDIR

FTPDir							
Purpose	To save remote file information in the current working directory to the file DIRList on the mobile computer.						
Syntax	S32 FTPDir (void);						
Example	<code>FTPDir();</code>						
Return Value	If successful, it returns 0. On error, it returns a non-zero value to indicate a specific error condition.						
	<table border="1"> <thead> <tr> <th colspan="2">Return Value</th></tr> </thead> <tbody> <tr> <td>-131</td><td>Failed to open DIRList</td></tr> <tr> <td>-133</td><td>Failed to download file information from working directory</td></tr> </tbody> </table>	Return Value		-131	Failed to open DIRList	-133	Failed to download file information from working directory
Return Value							
-131	Failed to open DIRList						
-133	Failed to download file information from working directory						
Remarks	This function will issue the LIST command to get the remote file information. File entry format depends on FTP server. Refer to 8.2.1 Remote File Information for file entry format. Refer to Appendix IV — FTP Response & Error Code. ▶ FTP messages are are stored in the global array <i>szFTPReplyCode[256]</i> .						
See Also	FTPCwd						

8.4.4 CHANGE DIRECTORY: FTPCWD

FTPCwd					
Purpose	To change the current working directory.				
Syntax	S32 FTPCwd (S8 *NewDir);				
Parameters	<div>S8 *NewDir</div> <div>Pointer to a buffer where the new directory is stored. Refer to examples below.</div>				
Example 1	<pre>FTPCwd((S8 *) "123"); /* change to the directory 123 located in the parent directory of the current directory */</pre>				
Example 2	<pre>FTPCwd((S8 *) "/Root/Temp"); /* change to the directory Temp by specifying absolute path */</pre>				
Example 3	<pre>FTPCwd((S8 *) ".."); /* Back to the parent directory of the current directory */</pre>				
Example 4	<pre>FTPCwd((S8 *) "/"); /* Back to the root directory */</pre>				
Return Value	<p>If successful, it returns 0.</p> <p>On error, it returns a non-zero value to indicate a specific error condition.</p> <table><tr><th colspan="2">Return Value</th></tr><tr><td>-132</td><td>Failed to change working directory</td></tr></table>	Return Value		-132	Failed to change working directory
Return Value					
-132	Failed to change working directory				
Remarks	<p>Refer to Appendix V — FTP Response & Error Code.</p> <p>► FTP messages are are stored in the global array szFTPReplyCode[256].</p>				
See Also	FTPDir				

8.4.5 UPLOAD FILE: FTPSEND, FTPAPPEND

FTPSend									
Purpose	To upload files.								
Syntax	S32 FTPSend (S8 *LocalFile, S8 *RemoteFile, S8 *ProcessOption);								
Parameters	S8 *LocalFile								
	Pointer to a buffer where the local file name is stored.								
	S8 *RemoteFile								
	Pointer to a buffer where the remote file name is stored.								
	S8 *ProcessOption Reserved								
	Pointer to a buffer where the preprocessing option is stored.								
Example	FTPSend((S8 *) "Tx1.TXT", (S8 *) "Tx1.TXT", (S8 *) "");								
Return Value	If successful, it returns 0.								
	On error, it returns a non-zero value to indicate a specific error condition.								
<table><tr><th colspan="2">Return Value</th></tr><tr><td>1</td><td>Local file name is empty</td></tr><tr><td>-134</td><td>Failed to find local file (= no file can be sent)</td></tr><tr><td>-135</td><td>Failed to send file to host</td></tr></table>		Return Value		1	Local file name is empty	-134	Failed to find local file (= no file can be sent)	-135	Failed to send file to host
Return Value									
1	Local file name is empty								
-134	Failed to find local file (= no file can be sent)								
-135	Failed to send file to host								
Remarks	Refer to Appendix IV — FTP Response & Error Code. ▶ FTP messages are are stored in the global array szFTPReplyCode[256].								
See Also	FTPAppend, FTPRecv								

FTPAppend

Purpose To append files to remote host.

Syntax **S32 FTPAppend (S8 *LocalFile,**
S8 *RemoteFile,
S8 *ProcessOption);

Parameters	S8 *LocalFile
	Pointer to a buffer where the local file name is stored.
	S8 *RemoteFile
	Pointer to a buffer where the remote file name is stored.
	S8 *ProcessOption Reserved
	Pointer to a buffer where the preprocessing option is stored.

Example `FTPAppend((S8 *) "Tx1.TXT", (S8 *) "Tx1.TXT", (S8 *) "");`

Return Value If successful, it returns 0.

On error, it returns a non-zero value to indicate a specific error condition.

<i>Return Value</i>	
1	Local file name is empty
-134	Failed to find local file (= no file can be sent)
-135	Failed to send file to host

Remarks This function is not supported by Bluetooth FTP. Calling FTPAppend() will get the same result as calling FTPSend().

Refer to Appendix IV — FTP Response & Error Code.

► FTP messages are are stored in the global array szFTPReplyCode[256].

See Also FTPRecv, FTPSend

8.4.6 DOWNLOAD FILE: FTPRECV

FTPRecv									
Purpose	To download files.								
Syntax	S32 FTPRecv (S8 *LocalFile, S8 *RemoteFile, S8 *ProcessOption);								
Parameters	S8 *LocalFile								
	Pointer to a buffer where the local file name is stored.								
	S8 *RemoteFile								
	Pointer to a buffer where the remote file name is stored.								
	S8 *ProcessOption Reserved								
	Pointer to a buffer where the preprocessing option is stored.								
Example	FTPRecv((S8 *) "Tx1.TXT", (S8 *) "Tx1.TXT", (S8 *) "");								
Return Value	If successful, it returns 0.								
	On error, it returns a non-zero value to indicate a specific error condition.								
	<table><tr><th colspan="2">Return Value</th></tr><tr><td>1</td><td>Local file name is empty</td></tr><tr><td>-131</td><td>Failed to open local file (= no file can save data)</td></tr><tr><td>-133</td><td>Failed to download file from host</td></tr></table>	Return Value		1	Local file name is empty	-131	Failed to open local file (= no file can save data)	-133	Failed to download file from host
Return Value									
1	Local file name is empty								
-131	Failed to open local file (= no file can save data)								
-133	Failed to download file from host								
Remarks	Refer to Appendix IV — FTP Response & Error Code. ▶ FTP messages are are stored in the global array szFTPReplyCode[256].								
See Also	FTPSend								

8.4.7 DELETE FILES FROM FTP SERVER: FTPDELETE

FTPDelete

Purpose To delete files from the FTP server.

Syntax **S32 FTPDelete (S8 *RemoteFile,**
S8 *ProcessOption);

Parameters	S8 *RemoteFile
	Pointer to a buffer where the remote file name is stored.
	S8 *ProcessOption Reserved
	Pointer to a buffer where the preprocessing option is stored.

Example `FTPDelete((S8 *) "Tx1.TXT", (S8 *) "");`

Return Value If successful, it returns 0, else -1.

Remarks Refer to Appendix IV — FTP Response & Error Code.
▶ FTP messages are are stored in the global array szFTPReplyCode[256].

See Also

Note: Such function deletes files from the FTP server only. It doesn't delete any file from the mobile computer.

8.4.8 RENAME FILES ON FTP SERVER: FTPRENAME

FTPRename

Purpose To rename the files on the FTP server.

Syntax **S32 FTPRename (S8 *RemoteNewFile,**
S8 *RemoteOldFile,
S8 *ProcessOption);

Parameters	S8 *RemoteNewFile
	Pointer to a buffer where the new file name is stored.
	S8 *RemoteOldFile
	Pointer to a buffer where the old file name is stored.
	S8 *ProcessOption Reserved
	Pointer to a buffer where the preprocessing option is stored.

Example `FTPRename((S8 *) "New.TXT", (S8 *) "Old.TXT", (S8 *) "");`

Return Value If successful, it returns 0, else -1.

Remarks Refer to Appendix IV — [FTP Response & Error Code](#).

- ▶ FTP messages are are stored in the global array szFTPReplyCode[256].

Note: Such function renames the files on the FTP server only. It doesn't rename any file on the mobile computer.

8.4.9 WILDCARDS FOR REMOTE FILE NAME (USER-SPECIFIED SRING)

GetUserWildCard

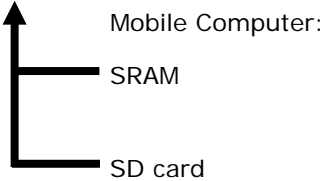

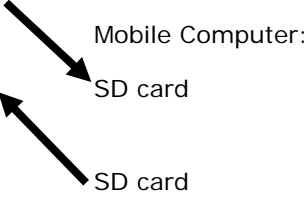

Purpose	To get the user-specified string.
Syntax	S8 * GetUserWildCard (void);
Example	<pre>S8 *pUserString; pUserString =GetUserWildCard(); printf("UserDefinedString:%s.\r\n", pUserString);</pre>
Return Value	If successful, it returns a pointer to where the value of "%I" is stored.

SetUserWildCard

Purpose	To set a string used as wildcard "%I" for the remote file name in the script.		
Syntax	S32 SetUserWildCard (S8 *UserString);		
Parameters	<table><tr><td>S8 *UserString</td></tr><tr><td>Pointer to a buffer where the string is stored.</td></tr></table>	S8 *UserString	Pointer to a buffer where the string is stored.
S8 *UserString			
Pointer to a buffer where the string is stored.			
Example	SetUserWildCard((S8*) "Cipherlab");		
Return Value	<p>If successful, it returns 0.</p> <p>Otherwise, it returns -1 to indicate the string length is over 16 characters, or the pointer is NULL.</p>		

8.5 FILE HANDLING

8.5.1 DAT FILES

Upload via FTP	Pre-processing of File in Format, Data, etc.
<div>Host</div> <div><p>Mobile Computer: SRAM SD card</p></div>	Not required
with SD card as mass storage	Pre-processing of File in Format, Data, etc.
<div>Host</div> <div><p>Mobile Computer: SD card SD card</p></div>	Not required

8.5.2 DBF FILES

Download via FTP

Pre-processing of File in Format, Data, etc.

Remote only: Use PC utility "DataConverter.exe" to create legal files (DB0; DB1~8 for IDX files).

Upload via FTP

Pre-processing of File in Format, Data, etc.

Remote only: Use PC utility "DataConverter.exe" to convert SD files (DB0; DB1~8 for IDX files) to legal files.

with SD card as mass storage

Pre-processing of File in Format, Data, etc.

Remote only: Use PC utility "DataConverter.exe" to create legal files (DB0; DB1~8 for IDX files).

Remote only: Use PC utility "DataConverter.exe" to convert SD files (DB0; DB1~8 for IDX files) to legal files.

8.6 SD CARD ACCESS

When a file name is required as an argument passed to a function call, it must be given in full path as shown below. Only absolute path is supported, and the file name is not case-sensitive.

Warning: Although file name may be case-sensitive on remote host, for use with SD card, it is suggested to avoid using letter case for identifying two files with identical file name, such as "AAA.txt" and "aaa.txt".

The maximum length of a full-path file name is 255 characters, where file name can be made up of 8 characters at most. Refer to [8.6.2 File Name](#).

File Path	File in Root Directory	File in Sub-directory
"A:\\..."	"A:\\UserFile"	"A:\\SubDir\\UserFile"
"a:\\..."	"a:\\UserFile"	"a:\\SubDir\\UserFile"
"A:/..."	"A:/UserFile"	"A:/SubDir/UserFile"
"a:/..."	"a:/UserFile"	"a:/SubDir/UserFile"

Note: (1) For DAT files, it does not matter whether filename extension is included or not.
(2) For DBF files, it does not require including filename extension.

8.6.1 DIRECTORY

Unlike the file system on SRAM, the file system on SD card supports hierarchical tree directory structure and allows creating sub-directories. Several directories are reserved for particular use.

Reserved Directory	Related Application or Function	Remark
\Program	<ul style="list-style-type: none">▶ Program Manager Download▶ Program Manager Activate▶ Kernel Menu Load Program▶ Kernel Menu Kernel Update▶ UPDATE_BASIC()	<p>Store programs to this folder so that you can download them to 8600:</p> <ul style="list-style-type: none">▶ C program — *.SHX▶ BASIC program — *.INI and *.SYN

\BasicRun	BASIC Runtime	Store DAT and DBF files that are created and accessed in BASIC runtime to this folder. Their permanent filenames are as follows:		
		DAT Filename		
		DAT file #1	TXACT1.DAT	
		DAT file #2	TXACT2.DAT	
		DAT file #3	TXACT3.DAT	
		DAT file #4	TXACT4.DAT	
		DAT file #5	TXACT5.DAT

Index file #4	F3.DB5			
Index file #5	F3.DB6			

		DBF file #4	Record file	F4.DB0
			System Default Index	F4.DB1
			Index file #1	F4.DB2
			Index file #2	F4.DB3
			Index file #3	F4.DB4
			Index file #4	F4.DB5
			Index file #5	F4.DB6
		DBF file #5	Record file	F5.DB0
			System Default Index	F5.DB1
			Index file #1	F5.DB2
			Index file #2	F5.DB3
			Index file #3	F5.DB4
			Index file #4	F5.DB5
			Index file #5	F5.DB6
\AG\DBF \AG\DAT \AG\EXPORT \AG\IMPORT	Application Generator (a.k.a. AG)	Store DAT, DBF, and Lookup files that are created and/or accessed in Application Generator to this folder.		

8.6.2 FILE NAME

A file name must follow 8.3 format (= short filenames) — at most 8 characters for filename, and at most three characters for filename extension. The following characters are unacceptable: " * + , : ; < = > ? | []

- ▶ The mobile computer can only display a filename of 1 ~ 8 characters (the null character not included), and filename extension will be displayed if provided. If a file name specified is longer than eight characters, it will be truncated to eight characters.
- ▶ Long filenames, at most 255 characters, are allowed when using the mobile computer equipped with SD card as a mass storage device. For example, you may have a filename "123456789.txt" created from your computer. However, when the same file is directly accessed on the mobile computer, the filename will be truncated to "123456~1.txt".
- ▶ If a file name is specified other in ASCII characters, in order for the mobile computer to display it correctly, you may need to download a matching font file to the mobile computer first.
- ▶ The file name is not case-sensitive.

BLUETOOTH SPP, DUN

DUN¹ refers to Bluetooth DUN for connecting a modem.

DUN² refers to Bluetooth DUN-GPRS for activating a mobile's GPRS.

Index		Remarks	SPP	DUN ¹	DUN ²
6	NET_IPReady	NETSTATUS Structure			✓
7	BT_State	BTSTATUS Structure	✓	✓	✓
8	BT_Signal		✓	✓	✓

EXAMPLES

WLAN EXAMPLE (802.11b/g/n)

Configure Network Parameters

Generally, network configuration has to be done in advance by calling **GetNetParameter()** and **SetNetParameter()**.

Initialize Networking Protocol Stack & Wireless Module

The wireless module, such as of 802.11b/g/n, Bluetooth, will not be powered until **NetInit()** is called.

Mobile Computer	WLAN (802.11b/g/n)	Bluetooth DUN-GPRS	PPP via RS-232
8630	NetInit() NetInit(0L)	NetInit(3L)	NetInit(5L)
8660	---	NetInit(3L)	NetInit(5L)

Check Network Status

Once the initialization process is done, the network status can be retrieved from the system. It will be periodically updated by the system. The application program must explicitly call **CheckNetStatus()** to get the latest status.

Open Connection

Before reading and writing to the remote host, a connection must be established (opened). Call **Nopen()** to open a connection. For example,

```
conno = Nopen(" * ", "TCP/IP", 2000, 0, 0);
```

Transmit Data

socket_cansend()

Before sending data to the network, call **socket_cansend()** to check if there is enough buffer size to write out the data immediately. It also can be used to check if the data being sent is more than 4 packets when there is no response from the remote host. Then, call **Nwrite()** to send data on the network.

socket_hasdata()

Before receiving data from the network, call **socket_hasdata()** to check if there is data in the buffer. Then, call **Nread()** to receive data on the network.

Note: In case of an abnormal break during PPP or DUN-GPRS connection, CheckNetStatus(IPReady) will return -1.

Other Useful Functions...

Refer to 2.4 Supplemental Functions.

Close Connection

Call **Nclose()** to terminate a particular connection, which equals to conno returned by **Nopen()**, when the application program does not use it any more.

Terminate Networking Protocol Stack & Wireless Module

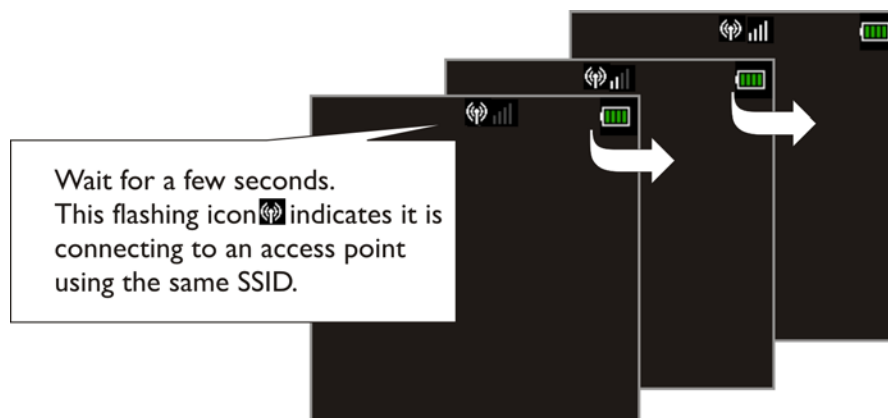

When the application program wishes to stop using the network, call **NetClose()** to terminate networking and shut down the power to the module so that it can save power. To enable the network again, it is necessary to call **NetInit()** again.

Note: After calling NetClose(), any previous network connection and data will be lost.

WPA ENABLED FOR SECURITY

If WPA-PSK/WPA2-PSK is enabled for security, SSID and Passphrase will be processed to generate a pre-share key. If you change SSID or Passphrase, it will have to re-generate a pre-share key.

- 1) For initial association with an access point, you will see an antenna icon flashing on the screen to indicate that the mobile computer is processing a pre-share key.

- 2) After having generated the pre-share key, the mobile computer proceeds to establish a connection with an access point.
- 3) When the mobile computer has been connected to the access point successfully, you will see the antenna without flashing and the indication of wireless signal strength.

Note: Be aware that these icons will appear on the device screen after NetInit() is called. (WPA-PSK/WPA2-PSK must be enabled first!)

BLUETOOTH EXAMPLES

SPP MASTER

Inquiry

Call **BTInquiryDevice (BTSearchInfo *Info, S16 max)** to discover nearby Bluetooth devices.

Pairing

Call **BTPairingTest (BTSearchInfo *Info, BTSerialPort)** to pair with a Bluetooth device.

Set Communication Type

Call **SetCommType (2, COMM_RF)** to set COM2 for Bluetooth communication.

Open COM Port

Call **open_com (2, BT_SERIALPORT_MASTER)** to initialize Bluetooth SPP Master.

Check Connection

Call **com_eot (2)** to detect if the connection is completed. For example,

```
while (1) {  
    if (com_eot(2)) break;  
    OSTimeDly(4);  
}
```

Transmit/receive Data

Call **write_com()** and **read_com()** to transmit and receive data respectively.

Check Connection

Call **com_eot (2)** to detect if the connection is broken. For example,

```
if (!com_eot(2)) printf("Connection break");
```

Close COM Port

Call **close_com (2)** to terminate communication and shut down the Bluetooth module.

SPP SLAVE

Set Communication Type

Call **SetCommType (2, COMM_RF)** to set COM2 for Bluetooth communication.

Open COM Port

Call **open_com (2, BT_SERIALPORT_SLAVE)** to initialize Bluetooth SPP Slave.

Check Connection

Call **com_eot (2)** to detect if the connection is completed. For example,

```
while (1) {  
    if (com_eot(2)) break;  
    OSTimeDly(4);  
}
```

Transmit/receive Data

Call **write_com()** and **read_com()** to transmit and receive data respectively.

Check Connection

Call **com_eot (2)** to detect if the connection is broken. For example,

```
if (!com_eot(2)) printf("Connection break");
```

Close COM Port

Call **close_com (2)** to terminate communication and shut down the Bluetooth module.

BLUETOOTH HID

Configure Wedge Settings

Bluetooth HID makes use of the **WedgeSetting** array to govern the HID operations. Refer to **Part I: 2.4 Keyboard Wedge**.

Subscript	Bit	Default	Description
0	7 - 0	1	KBD / Terminal Type
1	7	0	0: Disable capital lock auto-detection 1: Enable capital lock auto-detection
1	6	0	0: Capital lock off 1: Capital lock on
1	5	0	0: Alphabets are case-sensitive 1: Ignore alphabets' case
1	4 - 3	00	00: Normal 10: Digits at lower position 11: Digits at upper position
1	2 - 1	00	00: Normal 10: Capital lock keyboard 11: Shift lock keyboard
1	0	0	0: Use alpha-numeric key to transmit digits 1: Use numeric keypad to transmit digits
2	7	0	0: Extended ASCII Code 1: Combination Key
2	6 - 1	0	Inter-character delay (unit: 5ms)
2	0	1	HID Character Transmit Mode 0: Batch processing 1: By character

WedgeSetting[0]: It is used to determine which type of keyboard wedge is applied, and the possible value is listed below.

Setting Value	Terminal Type	Setting Value	Terminal Type
0	Null (Data Not Transmitted)	8	PCAT (BE)
1	PCAT (US)	9	PCAT (SP)
2	PCAT (FR)	10	PCAT (PO)
3	PCAT (GR)	11	IBM A01-02 (Japanese OADG109)
4	PCAT (IT)	12	PCAT (Turkish)
5	PCAT (SV)	13	PCAT (Hungarian)
6	PCAT (NO)	14	PCAT (Swiss(German))
7	PCAT (UK)	15	PCAT (DA)

WedgeSetting[1]: For details, refer to **Part I: 2.4 Keyboard Wedge**.

WedgeSetting[2]: It is used to configure how it sends data to the host, either by character or batch processing.

Set Communication Type

Call **SetCommType (2, COMM_RF)** to set COM2 for Bluetooth communication.

Open COM Port

Call **open_com (2, BT_HID_DEVICE)** to initialize Bluetooth HID functionality.

Check Connection

Call **com_eot (2)** to detect if the connection is completed. For example,

```
while (1) {
    if (com_eot(2)) break;
    OSTimeDly(4);
}
```

Frequent Device List

When there is a host device recorded in the Frequent Device List, the mobile computer (as SPP Master) will automatically connect to it. If the connection fails, the mobile computer will try again. If it fails for the second time, the mobile computer will wait 7 seconds for another host to initiate a connection. If still no connection is established, the mobile computer will repeat the above operation.

When there is no device recorded in the Frequent Device List, the mobile computer (as SPP Slave) simply must wait for a host device (as SPP Master) to initiate a connection.

Note: As an HID input device (keyboard), the mobile computer must wait for a host to initiate a connection. Once the HID connection is established, the host device will be recorded in the Frequent Device List identified as HID Connection.

Transmit Data

Call **write_com(2, *data)** or **nwrite_com(2, *data, len)** to transmit data.

Check Connection

Call **com_eot (2)** to detect if the connection is broken. For example,

```
if (!com_eot(2)) printf("Connection break");
```

Close COM Port

Call **close_com (2)** to terminate communication and shut down the Bluetooth module.

DUN

Inquiry

Call **BTInquiryDevice (BTSearchInfo *Info, S16 max)** to discover nearby Bluetooth devices.

Pairing

Call **BTPairingTest (BTSearchInfo *Info, BTDialogNetworking)** to pair with a Bluetooth device that can work as a modem.

Set Communication Type

Call **SetCommType (2, COMM_RF)** to set COM2 for Bluetooth communication.

Open COM Port

Call **open_com (2, BT_DIALUP_NETWORKING)** to initialize Bluetooth DUN functionality.

Check Connection

Call **com_eot (2)** to detect if the connection is completed. For example,

```
while (1) {  
    if (com_eot(2)) break;  
    OSTimeDly(4);  
}
```

Transmit/receive Data

Call **write_com()** and **read_com()** to transmit and receive data respectively.

Check Connection

Call **com_eot (2)** to detect if the connection is broken. For example,

```
if (!com_eot(2)) printf("Connection break");
```

Close COM Port

Call **close_com (2)** to terminate communication and shut down the Bluetooth module.

DUN-GPRS

To activate the GPRS functionality on a mobile phone via the built-in Bluetooth dial-up networking technology, follow the same programming flow of [WLAN Example \(802.11b/g/n\)](#).

- ▶ Before calling **NetInit (BT_GPRS_NETWORKING)**, the following parameters of DUN-GPRS must be specified.

Index		Default	Description
32	P_ BT_GPRS_APNAME [20]	Null	Name of Access Point for Bluetooth DUN-GPRS

ACL

Set 36xx Serial Number

Call **Set36xxParameter (SN, P_36XXSN)** to set serial number of the connected 36xx device.

Set Communication Type

Call **SetCommType (2, COMM_RF)** to set COM2 for Bluetooth communication.

Open COM Port

Call **open_com (2, BT_ACL_36xx)** to initialize Bluetooth ACL.

Check Connection

Call **com_eot (2)** to detect if the connection is completed. For example,

```
while (1) {  
    if (com_eot(2)) break;  
    OSTimeDly(4);  
}
```

Change 36xx Settings

U8 P;

P=ACL_PCAT_US;

Call **Set36xxParameter (&P, P_BTACL_Type)** to set interface type of the 36xx device.

Call **Set36xxParameter (0, P_SetTo36xx)** to set 36xx parameters while 36xx is connected and ready.

Transmit/receive Data

Call **write_com()** and **read_com()** to transmit and receive data respectively.

Check Connection

Call **com_eot (2)** to detect if the connection is broken. For example,

```
if (!com_eot(2)) printf("Connection break");
```

Close COM Port

Call **close_com (2)** to terminate communication and shut down the Bluetooth module.

USB EXAMPLES

USB VIRTUAL COM

Set Communication Type

Call **SetCommType (5, COMM_USBVCOM)** to set COM5 for USB Virtual COM communication.

Open COM Port

Call **open_com (5, setting)** to initialize the COM port, where the *setting* parameter is of no use.

Check Connection

Call **com_eot (5)** to detect if the connection is completed. For example,

```
while (1) {  
    if (com_eot(5)) break;  
    OSTimeDly(4);  
}
```

Transmit/receive Data

Call **write_com()** and **read_com()** to transmit and receive data respectively.

Check Transmission

Call **com_eot(5)** to check whether there is any transmission in progress. For example,

```
while (com_eot(5)); // wait till prior transmission completed
```

Close COM Port

Call **close_com (5)** to terminate USB communication.

USB HID

Configure Wedge Settings

Like Bluetooth HID, USB HID also makes use of the **WedgeSetting** array to govern the HID operations. Refer to **Part I: 2.4 Keyboard Wedge**.

Subscript	Bit	Default	Description
0	7 - 0	1	KBD / Terminal Type
1	7	0	0: Disable capital lock auto-detection 1: Enable capital lock auto-detection
1	6	0	0: Capital lock off 1: Capital lock on
1	5	0	0: Alphabets are case-sensitive 1: Ignore alphabets' case
1	4 - 3	00	00: Normal 10: Digits at lower position 11: Digits at upper position
1	2 - 1	00	00: Normal 10: Capital lock keyboard 11: Shift lock keyboard
1	0	0	0: Use alpha-numeric key to transmit digits 1: Use numeric keypad to transmit digits
2	7	0	0: Extended ASCII Code 1: Combination Key
2	6 - 1	0	Inter-character delay (unit: 5ms)
2	0	1	HID Character Transmit Mode 0: Batch processing 1: By character

WedgeSetting[0]: It is used to determine which type of keyboard wedge is applied, and the possible value is listed below.

Setting Value	Terminal Type	Setting Value	Terminal Type
0	Null (Data Not Transmitted)	8	PCAT (BE)
1	PCAT (US)	9	PCAT (SP)
2	PCAT (FR)	10	PCAT (PO)
3	PCAT (GR)	11	IBM A01-02 (Japanese OADG109)
4	PCAT (IT)	12	PCAT (Turkish)
5	PCAT (SV)	13	PCAT (Hungarian)
6	PCAT (NO)	14	PCAT (Swiss(German))
7	PCAT (UK)	15	PCAT (DA)

WedgeSetting[1]: For details, refer to **Part I: 2.4 Keyboard Wedge**.

WedgeSetting[2]: It is used to configure how it sends data to the host, either by character or batch processing.

Set Communication Type

Call **SetCommType (5, COMM_USBHID)** to set COM5 for USB HID communication.

Open COM Port

Call **open_com (5, setting)** to initialize the COM port, where the *setting* parameter is of no use.

Check Connection

Call **com_eot (5)** to detect if the connection is completed. For example,

```
while (1) {
    if (com_eot(5)) break;
    OSTimeDly(4);
}
```

Transmit Data

Call **write_com(5, *data)** or **nwrite_com(5, *data, len)** to transmit data.

Check Transmission

Call **com_eot(5)** to check whether there is any transmission in progress. For example,

```
while (com_eot(5)); // wait till prior transmission completed
```

Close COM Port

Call **close_com (5)** to terminate USB communication.

USB MASS STORAGE DEVICE

Set Communication Type

Call **SetCommType (5, COMM_USBDISK)** to set COM5 for the use of USB removable disk.

Open COM Port

Call **open_com (5, *setting*)** to initialize the COM port and its associated USB removable disk.

Close COM Port

Call **close_com (5)** to terminate USB communication.

FTP RESPONSE

ORIGINAL

FTP messages are responses to FTP commands and consist of a 3-digit response code followed by explanatory text. These messages are stored in the global array *szFTPReplyCode[256]*.

You may use the **printf()** function to get the message after executing an FTP command:

```
printf("%s", szFTPReplyCode);
```

SUMMARIZED WITH ERROR CODE

For **DoFTP()**, the message is stored in the global array *szFTPResponseTbl[1024]*. If an error occurs, the error code will be appended to the message, indicating the error condition encountered. Refer to [Error Code](#) below.

For example, the message could be "DoFTP OPEN OK!", "FTPOpen Failed.", etc. The latter indicates the command is invalid and has caused an error.

Use the **printf()** function to get the message:

```
printf("%s", szFTPResponseTbl);
```

ERROR CODE

GENERAL ERROR

Command	Error Code	Description
(Any)	99	Invalid Command

CONNECT ERROR

Command	Error Code	Description
FTPOpen	-3	Failed to resolve hostname to binary IP address
	-4	Failed to connect to host
	-5	Incorrect username

	-6	Incorrect password
	-10	Failed to set binary transfer mode
	-20	Host IP is empty
	-21	Username is empty

GET DIRECTORY ERROR

Command	Error Code	Description
FTPDDir	-131	Failed to open DIRList
	-133	Failed to download file information at working directory

CHANGE DIRECTORY ERROR

Command	Error Code	Description
FTPCwd	-132	Failed to change working directory at host

UPLOAD ERROR

Command	Error Code	Description
FTPSend	1	Local file name is empty
	-134	Failed to find local file at terminal (= no file to send)
	-135	Failed to send file to host
Command	Error Code	Description
FTPAppend	1	Local or remote file name is empty
	-134	Failed to find local file at terminal (= no file to send)
	-135	Failed to send file to host

DOWNLOAD ERROR

Command	Error Code	Description
FTPRecv	1	Local file name is empty
	-131	Failed to open local file at terminal (= no file to save data)
	-133	Failed to download file from host
